"Chelsea"

So much to see! So little chance to ponder — in the crowd! And your own garden is required to be a haven of rest, not merely an effort at decoration. But perhaps the Show may have given you some stimulus—better still, some IDEAS—toward the better making of your garden.

The experience of a man whose life up to now has been more or less devoted to overcoming difficulties with regard to the construction of outdoor gardens (town and country) is at your disposal. Perhaps he can help your wishes to materialise—in the way of an advisory visit—a bright and proportionate lay-out, a rock and water garden, or any kind of constructional work, or a planting plan.

SHERWOOD CUP

This Cup for the MOST MERITORIOUS EXHIBIT
the Great CHELSEA SHOW of 1929 was awarded
Messrs. SUTTON & SONS for a MAGNIFICEN
EXHIBIT of GREENHOUSE FLOWERIN
PLANTS GROWN from SEED, in addition to th
Society's GOLD MEDAL, this being the third tim
during the past nine years that this coveted Troph
has been won by Messrs. Sutton.

Not the least remarkable feature of the superb Exhibi
was the fact that it was composed almost entirely
of choice flowers raised from seed.

Perhaps the most attractive flowers were the Hybrid Cinerarias in delightful shades of blue and pink, both of which come true from seed, Schizanthus retusus in beautiful colours, Schizanthus Wisetonesis, Calceolaria (Sutton's art shades), Salpiglossis, Lobelia ramosa, Gloxinias, and Begonias.

Notes from a West Somerset Garden

E losses caused by the exceptional osts of the past winter (17 degrees and degrees on several nights) have rly been heavy. All the Acacias in my e were killed in March, 1928, with the on of several A. dealbata, but these ld also last February. Other fatalities Cantua dependens, Clianthus puni- , assia corymbosa (a large, old plant), heterophylla and S. Drummondii, mon speciosus, a large Olearia semi- , young plants of Cytisus fragrans, a megastigma (a big) large-flowered Abutilons, Buddleia asiatica. All as have been cut to the , but most (except F. cens) are starting to shoot he base. Several large of hybrid Veronicas were d outright, others severely . Nerium Oleander is the ground, but is not d A big plant of Calliste- lignus lost every leaf, but breaking right along the ces. Metrosideros lucidum ld little damage, only shoots being killed. Cal- a violacea was struggling over from the previous s damage, and has again ut to the ground. The n Myrtles are not seri- y hurt, but the African -leaved varieties are bad- rned. An old straggling of Cistus purpureus has illed, but younger bushes he Cistuses are otherwise ch hurt. It is good to he recently introduced a truncata absolutely d and uninjured.

surprising survival is bryanthemum agninum, the most fleshy and ten- king species; a fair- lant growing on the top y wall suffered no injury now in flower. M. crassulinum and operi, on the same wall, are also un- ed. The only protection they received thin pane of glass overhead to ward vy rain. Both Rhodostachys pitcairn- and R. andina have perished utterly former had stood six winters unhurt. gia nutans is severely damaged, but rvive. The most serious losses are a r of large Cordyline australis, whose crowns have rotted, and nothing re- but the tall, gaunt trunks. These may kely break from the base, but the noble stature of these stately Palms is completely lost. The broad-leaved Cordyline indivisa has also had the crown destroyed, but is showing growth from the roots. The Chusan Palm (Chamærops Fortunei) shows no sign of distress.

Fortunately the cold weather in January retarded growth, consequently when the severe frosts came in February, Hydrangeas, Tree Pæonies, and many other shrubs were so little developed that they escaped injury and now look exceptionally well. The sweet-scented Rhododendron, Lady Alice Fitzwilliam, not only survived the frosts, but is now a sheet of blossom which scents the garden. All Lilies have made good growth; and Alpines have undoubtedly benefited by the long enforced rest.

"Iris japonica Ledger's Variety has flowered with unusual freedom"

This is a bardy form of a tender species

Iris japonica (Ledger's Variety) has flowered with unusual freedom; I. Wattii suffered slightly and the flowering stems are shorter than usual. Lemon-scented Verbenas (Aloysia citriodora) are late in starting into growth, but are coming at last from the base and well up the main branches. Every plant of Leptospermum scoparium (type with white flowers) has been killed, but L. s. Nichollii and seedlings from that variety have pulled through. An old plant of Erica australis, fully exposed to the east, was destroyed early in the frost, and a good many branches of E. Veitchii have been badly split. A young plant of Adenocarpus Bacqui is quite uninjured; and it is good to find Cytisus proligerus only nipped at the tips of the shoots. C. supranabius is unhurt, as is C. monspessulanus.

Tricuspidaria lanceolata is very slightly injured here, but T. dependens has lost all its leaves. The broad-leaved form of Hoheria populnea is also leafless, but rapidly recovering; while the narrow-leaved form did not suffer.

Clematis Armandii (La Mortola form) has flowered splendidly on an old Apple tree, but C. indivisa has been nearly killed.

N. G. HADDEN.

West Porlock, Somerset.

NOTES OF THE WEEK

A silver cup for Pæonies

THE fourth of a series of cups presented by Mrs. Edward Harding is offered for award in 1929 for the best exhibit of three flowers of each of six varieties of Pæonies shown by an amateur. Banksian medals in silver-gilt and silver are offered by the Society as second and third prizes. The competition will take place at the fortnightly show at the Society's New Hall in Greycoat Street on June 25th, and all exhibits must be ready for judging by 11 a.m that day. Entries for the competition must be made on forms obtainable from the Secretary, Royal Horticultural Society, Vincent Square, Westminster, S.W.1, by whom the completed forms must be received not later than by the first post on Monday, June 17th.

Aldenham House Gardens

By kind permission of the Hon. Vicary Gibbs, the gardens of Aldenham House will be open to the public on the Saturdays of July, August, and September, and August Bank Holiday, on the same conditions as before: (*a*) that dogs cannot be permitted, and (*b*) that children must be in the control of a grown-up person. One Saturday, July 20th, is excepted, this being the date allotted to the Elstree and District Horticultural Society for their Floral Fête, when admission is only by payment of the Society's charges at the gates, or by ticket.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Double white Lilac

PERHAPS this photograph of double white Lilac may interest readers. When it was taken the trees had been planted about 20 years, and, although in an exposed position on the east coast of Durham, had never failed to show a wealth of bloom every spring. SARAH ROBSON.

Iberis Little Gem

I was interested in Mr. S. Arnott's remarks on this miniature variety of Iberis sempervirens in the issue of GARDENING ILLUSTRATED for May 4th. As he truly says, Little Gem does seem to appeal with special force to the grower of rock plants. This small, neat sub-shrub, of compact habit of growth, has a charm and attraction entirely its own. Unfortunately for him, his plants appear to have come through the ordeal of the exceptionally severe winter rather badly, but, as a general rule, this little plant survives unscathed. In normal seasons it commences to flower in April, and, later on, the small, bushy plant is literally covered with its small white flowers and the new green leaves act as a pleasing foil, enhancing its beauty in no small degree. It is equally suited for growing on the rockery, in the crevices of a wall, or even on the flats, though it appears to better advantage in a slightly elevated position. J. L.

Birmingham.

Tulipa chrysantha

This is a most attractive little Tulip which has here reached a height of about 10 inches, this being rather more than that recorded in most works of reference. The flowers are of moderate size and of rather starry form, opening out practically flat and of a golden yellow. My bulbs of T. chrysantha were planted in autumn, and it was with some trepidation that I thought of them during the long Arctic spell we experienced last winter. I look upon T. chrysantha as a great acquisition to the choice border of hardy flowers or the rock garden. I believe these bulbs came from Kashmir, but T. chrysantha is recorded as being found also in Persia. Farrer calls it "a golden yellow T. montana from Afghanistan, with the added advantage that its bulbs are savoursome and nourishing as a chestnut." This is a Tulip which one would never desire to be without after having it in flower. S. ARNOTT.

Double-flowered white Lilac on the east coast of Durham

Double Bunch Primroses

I was very interested in the note by Rev. William Murdoch on double Primroses and double Polyanthus (issue May 18th, page 329), and am writing, not, I am afraid, that I can give the information required, but to suggest that it may be obtained from J. Stormonth, of Kirkbride, Carlisle, who at one time held a stock of Bon Accord Primroses raised by Cocker, of Aberdeen. F. A. H.

—— Your correspondent has got the Hybrid Double Primroses raised by Thomas Cocker at a nursery near Aberdeen; they are of the same type as A. de Moulin, *i.e.*, come in bunches on a stem sometimes. The true double Polyanthus grow on stiff stems, and, I think, Curiosity (pink and yellow), Rex Theodore (red and yellowish), Harlequin, Tortoiseshell, and Prince Silverwings (an old Irish laced purple), are the only examples left. There is a true double Polyanthus also raised by Cocker (red-purple), called The Gem. I have one plant of it. I would be glad to exchange some double Polyanthus or some double Primroses for some Claret margined white of your correspon fancy the Wallflower-red mentioned Bon Accord but Mme. Pompado these doubles are becoming more di find, and prices are high. I have many Marie Crousse which is ro margined white. The Black Pompado to be defunct. E. D.

Prospect House,
Bushy Park Road,
Dublin, Ireland.

A retrospect

Some three years ago, following in GARDENING ILLUSTRATED on the Nanny Apple, I received a letter fro friend whom I had not seen for ma (the late Mr. Will Tayler) offering to a small tree. The offer was g accepted, the tree arriving in due co was carefully planted. This year it ing flower, so I hope to renew my a ance with an Apple I have not seen for some 60 years. What makes it interesting is that the shoots from w tree was raised were obtained from orchard where, as a school-boy, helped to gather Apples. E. Bu

Queen wasps

The question of queen wasps h brought up several times recently DENING ILLUSTRATED.

I should like to add that I thin wasps are more numerous this year other year before.

I will not explain now my reasons why they are so numerous, but I an everything has been in their favour s autumn.

But I want to add that I have ki last six weeks, 49 queen wasps many I had killed before that, no doors, but inside amongst the Pea the Vines, and Melon-house.

Rhubarb leaves, I have discovered best means of trapping them.

Quite by chance I took cover fron my Peach-house whilst preparing and left the leaves behind for a da next day I killed 10, and since the been using Rhubarb leaves as traps.

I should like to know if other read noted such a number in one year.

By the way, I am still killing the

J. T. DISNEY,
Gardener to Col. E. R. C
Northmoor, Dulverton.

A chance colour effect

A lovely little "bit" was found b day in a somewhat neglected borde garden. This was a patch of li Gentiana acaulis in front of, and among, a quantity of the deep, pu Atriplex hortensis seedlings, self-so about 3 inches high.

The Gentiana has flowered better t before in black, peaty soil, though su a lime lover. I shall keep the Atrip pinched back, and I hope the combin colour will occur again when the Delphiniums flower at the back of t

Another "picture," just over, Mertensia virginica, planted next of the Chinese Rhododendrons, impeditum, fastigiatum, and hippop The exquisite, clear blue of the f Mertensia, with its pale emerald leav out against the purples and mauve spreading mass of little Rhododendr most telling and carefully planned effe tensia's fairy bells ring for me in su beauty, and even push their way white Heaths. For years they baff but now I try to believe I like the

llac (which I can't grow). Mertensias
week in water when cut, even in Lon-
vase of them mingled with Viburnum
is indeed a joy—one smells of Cow-
d the other of Daphne.

ALICE MARTINEAU.

Pomaderris elliptica

our issue of March 9th last, I was
ed to see mention and an illustration
his plant (Maori name Kumarahon),
d at the R.H.S. meeting on February
s I have not heard of it being shown
sly in England.

e not a showy plant, it is a shrub of
l foliage and growth, very prodigal
production of large terminal trusses
y, buff yellow bloom. North of Auck-
n the poor waste land from which
gum is dug, it is very plentiful, and is
known as Poverty Weed or Gum-
' Soap. It acquired the first name
to its liking for poor, dry, clay hills;
ond, because it is said the flowers con-
saponaceous quality producing a

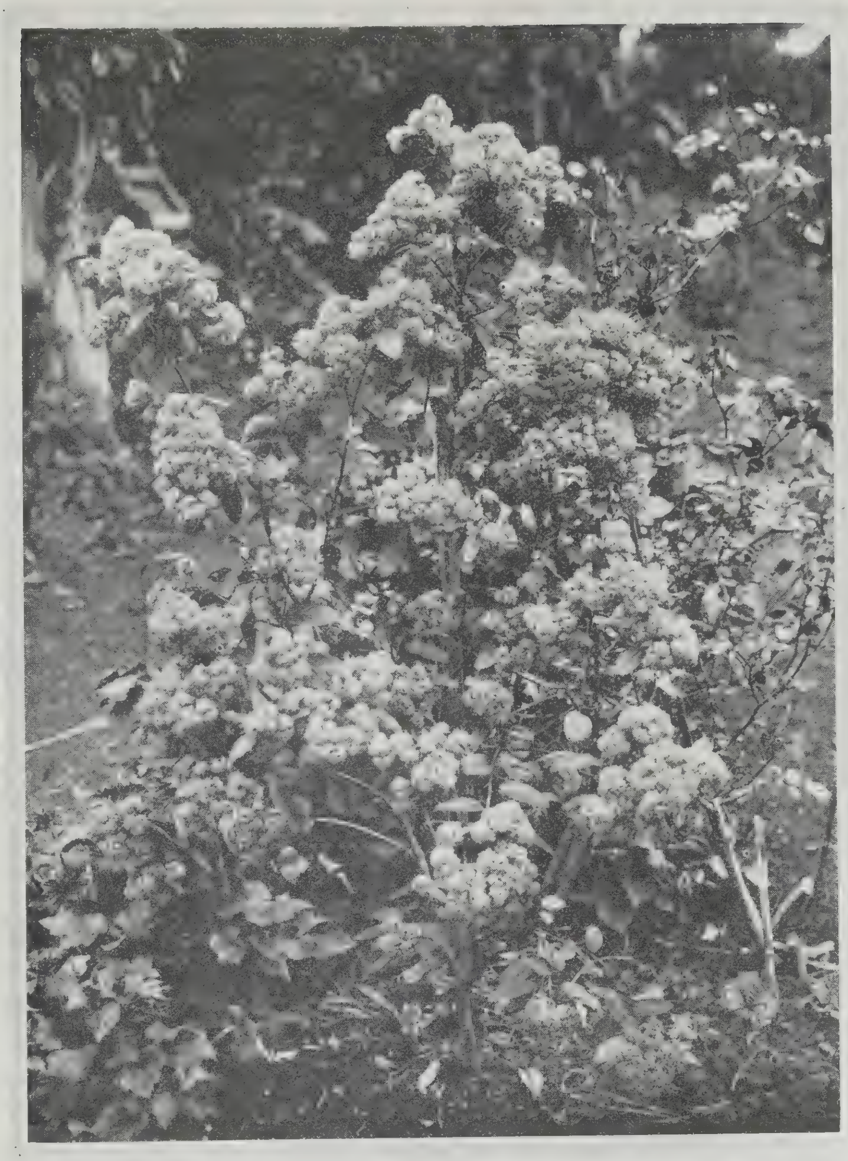
Tulipa ingens

G. S. Thomas, in his most interesting
on "Tulip Species," mentions
ingens, which he describes as of
st dark scarlet." Definitions of
are apt to vary widely. I, however,
certainly not call "ingens," as I
t, of "richest dark scarlet"; mine is
tremely vivid vermilion-scarlet. The
are, as Mr. Thomas describes,
us. It is tall and early, and has an
ely striking and handsome flower. I
ever been absolutely certain as to its
ty. The bulbs were brought to a friend
me from the roof of a sacred temple in
and were given to her as "ingens."
e to Van Tubergen in the autumn for
of "ingens" to compare with mine,
told me that he was unable to supply
I should be much obliged if any of
eaders can kindly tell me where this
can be obtained. I have had the
s of my variety painted.

lin. H. M. WHITE.



Pomaderris elliptica (Kumarahon) in New Zealand

ng flowers in small gardens

complete collapse of Wallflowers in
te exceptional winter has been a loss
as we look to them to furnish a pleas-
splay during the spring months, and
the many different shades now avail-
ne can have a good variety of colour.
ver, there are other things that have
through safely, so that we are getting
ht and pleasing display. It would be
lt to find a more acceptable flower for this season than the double white Arabis, as it adapts itself so well to the companionship of other things, whether it be Forget-me-not or Silene in mats, or bulbs as Tulips, or Hyacinths dotted about it. I think, however, my most pleasing effect this year is where it is sparsely planted among some plants of a tall, dark seedling Polyanthus. The large heads of bloom are standing just above the white spikes which are bending and nodding about them. The secret in securing fine young seedling plants of Polyanthus is to sow early and transplant into good ground at an early date before the roots are likely to be damaged by removal. I thought we should have lost a considerable percentage of the Forget-me-not, but it has picked up wonderfully since the advent of milder weather. A great favourite a little later is the old London Pride (Saxifrage umbrosa); this, too, associates well with many other things. I have it on a small border with some clumps of Maggie Mott Viola, and the effect is decidedly pretty. Another old favourite now flowering with large heads of bloom, at some 2 feet from the ground, is Lunaria biennis (Honesty), the plants scattered over a small area with the dwarfer Forget-me-nots and Pulmonarias beneath; the foliage of Pulmonaria saccharata is decidedly pleasing and effective by the side of the Forget-me-not.

E. BURRELL.

Pentas carnea

Those who can command a winter temperature of 50 degs. will be able to grow this Pentas successfully. It is a useful plant, blooming at a time of year when variety is much needed. Young growths make roots freely, and the plants grown on in free, rather light soil, and stopped twice, will be ready for a final potting into 4-inch pots early in July. The following year, if cut back, they may be put into 6-inch and the strongest into 7-inch pots, repotting when the young growths are about an inch long. These will make strong specimens, which can be used for conservatory decoration or to furnish cut bloom. J. CORNHILL.

Staking herbaceous plants

This will be a constant source of occupation for the next few weeks, and I know of nothing so desirable for the purpose, or happy in their relation to the plants, than sprays of Hazel instead of the unsightly array of bare stakes we too often see. These become absorbed among the leafage of the plants in quite a short time, and, while filling their purpose admirably, are scarcely seen. It is better, in the case of frailer growing plants, to use small sprays as the first protection to prevent squatting, adding taller ones as the plants advance. E. M.

Rhododendron Vaseyi

ONE of the most beautiful things in the garden at the present time is this shrub from the Carolina Mountains, which, for some reason, appears to have been neglected in gardens generally.

This is difficult to understand, as apart from its charming and very desirable wealth of clear, pink flowers, it is one of the most distinct American species we have.

A large group of plants purchased—when not more than a foot in height—some few years ago from a famous Surrey nursery, and now about 6 feet high, is one delightful loose mass of bloom and conspicuously effective. The flowers appear at the end of April and are effective throughout the greater part of May, arriving in advance of the leaves. No more charming subject could be desired as a cut flower when the plants are growing freely and happy, sprays 2 feet in length being available; but when growing in stiff and unsatisfactory soil, growth is less open and free. As the buds expand, the colour is deep pink, paling slightly with age, and I notice that seedling plants vary slightly, though all are lovely.

Rhododendron (Azalea) Vaseyi, flowers clear pink

This species is remarkably hardy and has come through the past severe winter unscathed. The soil in which the above are growing is of a sandy nature, and the position full south, and I suspect that the hot days of the past summer have played their part in the production of this bountiful profusion of bloom. E. MARKHAM.

Sussex.

The ubiquitous Clematis

Opinions may differ as to the best time to plant Clematises out of doors, but my experience prompts me to say that it is work which may be undertaken almost at any time, having regard to the fact that they can always be purchased in pots. Clematises are easy to grow; they embrace many varieties, which are serviceable for many purposes, both for the dweller in the country and for those who may only have a small garden within the heart of a town; but to see them at their best it should be recognised that some preparation of the ground is essential. With this in view, it is well to dig out the place where the plants are to be planted to the depth of 3 feet, putting at the bottom broken bricks or pots to ensure proper drainage, without which success cannot be expected where soil is naturally of a heavy nature. Good loam and rotted manure ought to be provided, and some mortar rubble will help matters. If it is difficult to obtain manure, it will be found that these plants, contrary to general belief, will do very well in a compost in which rough leaf moul
substitute. Planting should be done
spreading out the roots carefully aft
ing plants out of pots.

The two principal sections of Cle
viz., Jackmani and lanuginosa, o
grower a wonderful choice. The
flower best on the wood produced in

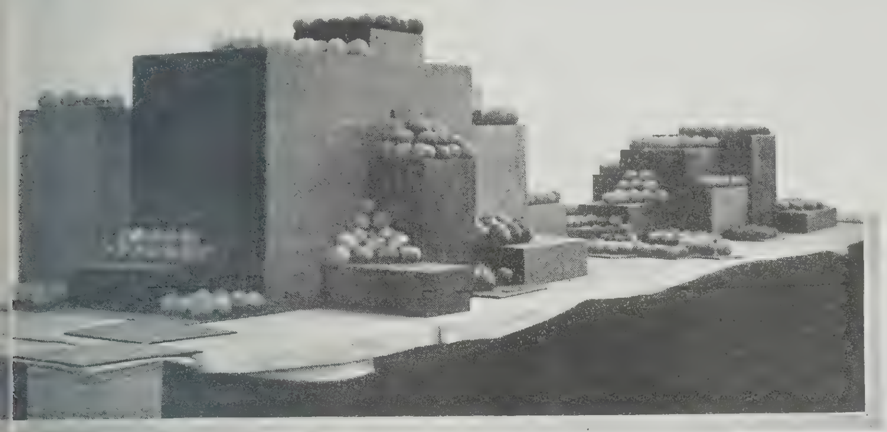
OMMENTS ON THE CHELSEA SHOW

Chelsea next year

I show at Chelsea is, in general,
' much like the last, and this great
pome of English floriculture grows
nan changes; year by year the Glox-
t a little larger and the Delphiniums
taller. But this year there are, at
o variations from type that seem to



e arrangement of Bunyard's Apples is a distinct breakaway from the basket or dish
thod, and the whole scheme is evidently influenced by the cubist movement. Vast
bes of black tower one above the other rather in the manner of New York's skyscrapers,
d the fruit is piled on these without baskets or dishes. The gold and red of the Apples
ow admirably on such sombre backgrounds. and the whole represents an attempt to
break away from the stereotyped methods of showing fruit

hdow changes to come. One is Mr.
d's display of Apples and the other
alley of Death.

Apples will catch everyone's eye. In-
f nestling in quiet harmony, as here-
e on beds of russet leaves in wicker
e, they are set out on geometrically
black blocks, with which they con-
bruptly in shape and colour. Some
are saying that this arrangement is
nyard's allusive way of announcing
se by his firm next year of the square
which has been so long demanded by
king trade. But there is nothing in
rmour; the arrangement is simply an
tion of the principle of contrast,
is new to a Chelsea long wedded to
ny. We have become used to groups
ins blending with one another like
ice-creams of many flavours, and to
e Peas harmonised into fountains of
nt foam; but if Mr. Bunyard's ges-
kes effect, we may expect to see next
e new Lupins rising, like Aphrodite
on the shores of Cypress, from
r blocks of white marble or black
, and the Sweet Peas attended by the
features of the less prepossessing

h Valley of Death fulfils, sooner than
ected, the desert gardens that we fore-
st year as a feature of the Chelsea
ifty years hence. No doubt it will be
ed; for, to the many who live in
s, there is a charm in trackless wastes
, quite naturally, not shared by those
ave to track across them. Next year
y hope to see a reproduction of the
Desert, with its sun-bitten Xerophytes,
ng bones, and authentic remains of an
tion which took the wrong turning.

all want what we have not; hence
pularity of rock gardens among people
se surroundings rocks are as rare as
In this respect, the perfect rock
is a garden made of rock and not
ed by flowers, an ideal to which Mr. Gavin Jones has strained a little nearer this year in his rock garden, which, except for a slight efflorescence of Violas, stands up stark in austere and naked beauty. It is said to have shocked the judges, who turned with relief to the neighbouring rock gardens which were hiding their bareness modestly in the usual chiffon of Phlox Vivid and Aubrietia. Next year, perhaps, we shall see the pure rock graden, "austere, unflowered, unalloyed," with no other decoration than a faint patina of ancient lichens.

All gardeners since Adam, the first gardener (to whom we owe so much), have yearned after what we have not got. I remember seeing a gardener in Herzegovina making a garden by blasting away the rocks with oaths and little sticks of dynamite, and I said to him, very foolishly, that in my country we put rocks into our gardens and paid people for doing so; but he only looked at me strangely and crossed himself.

F. A. H.

Sink gardens at Chelsea, and other things

In the avenue of the Formal Gardens, on my way to the exhibit of Sink Gardens, I was glad, very glad, that there was humour to temper the envy of these gardens of peace.

Half way along was the garden of Rebecca, complete with well and pitcher, but the English village atmosphere had been superimposed by an ancient, cast-iron pump, so ancient that the maker's name on a large plate was the most striking feature on its comely proportions. Instinctively one's thoughts flew to the parallel of those Eastern antiquities which first see the light of day in the Ladywood Road, Birmingham. Then there was a Japanese garden possessed of many stones full of religious significance. Distributed in odd corners of this quaint slice of Japan were large, round flints. "Perfect view stones" or "cave stones," perhaps, which may have come from the pot-holes of Yorkshire. Near a bed of Hydrangeas was a rotund mother cave-stone as large as a football, with a brood of healthy flintlings as big as croquet balls playing round her like a litter of pigs.

Then in any odd corner were other round-faced flints disporting on the banks and browsing under Japanese Maples; altogether very quaint, but, of course, it was not a common or garden Japanese garden which one saw at Chelsea. No, it was a bowling green of the first Ming dynasty, complete with flint woods. I still keep wondering how much the inscrutable designer paid his children to collect those flints. No boy under sixteen could have tackled the football-sized flint, and it

One corner of Sutton and Sons' group awarded the Sherwood Cup as the most meritorious exhibit at Chelsea

Within this comprehensive display were large and superb groups of Nemesias, Calceolarias, Gloxinias, Streptocarpus, Cinerarias, Salpiglossis, and Tuberous Begonias—a brilliant collection beautifully arranged was worth, at least, two Saturdays' pocket money.

Arrived at the Sink Gardens there were, as one was to expect, sinks to suit all pockets. When I say "all pockets" I mean that a bow-fronted Queen Anne or a small, early Victorian subsidy sink was priced at, perhaps, seven guineas—*guineas*, as in tailoring—though the prince of sinks, which was not really one at all, but slabs of slate giving a miniature garden some 9 feet or so in length, was ticketed at £50. I felt quite grieved it was not 50 guineas. Here we had a miniature pond, complete with goldfish, and Mr. Clarence Elliott assured me that these were included in the price, though I saw no packet of ants' eggs. Here I was reminded that, walking through Blythe Bridge a month ago, I saw a still larger sink in a stone-mason's yard, but turned it down as something altogether too large. It would have required a pond, some perch, and a punt to give proportion.

The lesson of the sink gardens, which it was worth anyone's while to visit, and learn, if interested in this fascinating form of gardening, was one which I have tried to stress on several occasions in GARDENING ILLUSTRATED. It was, not to be afraid of using plenty of stone in the construction. Here some of the outcrops rose nearly 2 feet above the sink sides, and, perhaps, in sinks originally weighing 1 cwt., twice its weight of rock had been employed to make the outcrop. Compare this with many of the photographs reproduced of sink gardens, and picture the entirely different effect procured. Here one could see the peculiar beauty of Saxifraga Baldensis for this form of miniature garden, and the glory of Viola Bertolonii, the china-blue Pansy from Corsica, when occupying a cranny at the base of a rock.

"Viola pedata offered at the modest price of ninepence . . . is a very tempting addition to the sink garden"

But the purpose of my journey to Chelsea was to discover likely new plants for trying out in sink gardens, and for those who are interested are passed on these notes.

First for the Dianthus family, to which there is an ever-increasing collection of small hybrids. The untidily tidy Dianthus neglectus was conspicuous by its absence, the species having apparently suffered severe losses last winter; and plants of its glorious hybrid, D. Roysii, exhibited to such effect at the autumn show, were very scarce. Both these plants can be wonderful in a stone trough.

Messrs. Bowell and Skarratt had a flesh-coloured D. Freynii named pallida, though the name is probably not authentic. This plant would be a useful addition to the type which does well on a miniature outcrop.

This season D. microlepis rumelius was flowered well by several firms, and will, no doubt, have tempted many purchasers, who will, alas! find it a shy bloomer in average seasons. There is a new little hybrid, D. Ivy (rather like D. Enid), cherry pink in colour, and probably a cross between D. neglectus and D. deltoides; also D. Prince of Wales, a brilliant crimson, originally raised by Messrs. Prichard, and again making its appearance. There are many improvements on our old friend, D. Cæsius, among which may be mentioned D. Icomb Hybrid; and all of these are good for a trial in a sink garden where Dianthuses are so signally at home.

I rather think that Erinus Dr. Hanele is not proving so hardy as one would like. It has died on me twice, and the specimens were small and very limited this show.

Aster Mount Everest, reminiscent of Erigeron leiomerus, but with flowers as big and similar to Aster alpinus, must surely have a place in the Alpine lawn. Messrs. Tucker had some beautiful little plants of Saxifraga diapensioides primulinum in flower. This plant has done very well in my sink gardens, and has the added attraction of being rare. A Saxifrage new to me was S. muscoides pygmæa, just what was wanted for the lowest slopes of the sink garden to cover the choicest little Narcissus bulbs—a great acquisition shown by Mr. Wells, of Merstham.

Viola pedata was offered at the modest price of ninepence, and however intractable, like Anthyllis Dilleni atrococcinea, newly arrived from the Pyrenees, is a very tempting addition to the sink garden.

Wadded in a northerly, vertical crevice, Ramondia pyrenaica will flourish in a trough; and now we once more have R. serbica stocked by several firms,
added attraction of being smaller an
shallow basin instead of reflexed flo

design his position as a judge. Some e idges this year allowed themselves to lk round exhibits here and there by ners and have the principal features id to them! This is, surely, out of

EXHIBITOR.

ock gardens at Chelsea

our issue of March 30th, I found sh to inveigh against the clamour for stone at Chelsea, remarking that the ousiness was a confession of artistic ess, or else gigantic egoism. The work u so-called rock artists at this year's xonerates them from the latter charge cost of fixing the first upon them.

e are varieties of stone enough for any- aste—or distaste. But there are only chibits of outstanding merit.

r Geo G. Whitelegg's rock garden s description. When I saw his Sher- up show in 1927, I said that it could .be improved upon; but this year's ts grander, more imaginative, than any s work by the same artist. It occu- e central site on the rock bank, and it d to be the centre of attraction also. he work of an artist of outstanding it and, as I said in my former letter, man will achieve outstanding effects t changing his medium.

h other exhibit referred to is that c Gavin Jones. Here is a man who has scovered the best medium for his par- style of work. He did right to change ne. His work has always possessed a a rigid severity; he has a penchant for sing Nature angularly. He is a faith- dent of geology, and his work has a ey and a certain sombre beauty all its . Its balance is perfect. All the same, ot the type of rock garden with a uni- appeal. It leaves little room for it is eminently unsuitable for small is, and its severity of line will tell it it with many people.

other rock gardens are puny attempts id these two. Hodson's, however, have aly improved on last year's show, and onotony of line is gone from their work. hm's, too, have given up their well- style, and have executed a restful of unambitious character.

lence Elliott must be judged by his and not his rock-work, for the latter en the joke of the show for years— tentional joke, as many think. Mr rsen, too, is obviously exhibiting plants

Orpington Nurseries have a really e little garden, showing a grassy hollow in the mountains flooded by recent heavy rains. The planting is quietly suggestive.

C. PENROSE.

Taplow.

The trout stream and pool by Hodsons, Ltd., had many admirers

—— *Re* the report on the Chelsea Show rock gardens (page 360 in your last number), I would very much like to call attention to one paragraph—that regarding the exhibit of Mr. Gavin Jones.

The whole paragraph reads as though the writer were labouring under a prejudice in favour of mountain limestone. Firstly, I would use the word "magnificent" or "splendid" rather than "gigantic"—because the exhibit is much more than gigantic. To cast a doubt upon the value of this piece of work in the garden, I regard as criminal—unless one means the small garden of a small semi-detached villa residence. In other words, the exhibit would be quite as much at home as any other in a garden of the right size. I say this, quite apart from the fact that there are people from the north or mountainous countries, generally (generally also lovers of Beethoven), with thoughts deep enough to appreciate the depths of the note sounded by this piece of work. I wish your writer had said "Nature pretty" instead of "Nature beautiful," but, of course, he would have defeated his own purpose. The only fault I had to find with this exhibit was its planting—which I thought rather too pretty. I think other plants should have been used on the lower strata to preserve the note of spiritual and artistic unity. It was, if I may say so, rather like dressing Sir Oliver Lodge in Oxford bags and a Fair Isle jumper.

At this show, I think, the wisdom of the appeal by the R.H.S. for a change of material has been vindicated. At the same time, I think Messrs. Hodson's have given a very bright example, especially in their *design* of the effect of a complete garden in the old north-country mountain limestone. The grass is in good-sized stretches, making it easy to keep in order. So, sir, art critics will always be brow-beaten and defeated by those who do the work.

JOHN WOOD.

Big bud in Black Currants

It was comforting to learn from the lecturer at the East Malling exhibit at Chelsea that a cure and preventative has been found for this. The patient man answered everyone's questions on every subject, and this was his answer to mine: "Spray with lime-sulphur wash in spring when leaves are about an inch across." Spray both infected trees and clean trees—the Big Bud will have no further terrors for you.

ALICE MARTINEAU.

The higher standard at Chelsea

May I, a garden lover who sometimes works in his own garden, suggest that the speech of the President of the R.H.S. delivered at the Society's luncheon on Tuesday last week would have better reflected public opinion if it had suffered slight alteration?

His pontifical utterance ran thus:—"Year after year we set our exhibitors a higher standard, up to which, I am glad to note, they are able to live." He would have found many more to agree with him if he had said: "Year after year the exhibitors set us (the Council) a higher standard up to which we are not able to live."

The Council do not radiate effulgence by virtue of wearing distinctive badges at their flower shows, they can only claim importance in horticulture in ratio to their efficiency. At present their claim seems to be growing in inverse ratio to it.

GARDEN OWNER.

[We were present at the speech in question, and we do not agree with the construction that "Garden Owner" has placed upon its meaning. The President was speaking of the higher standard of exhibits. It is, therefore, the exhibitors (not necessarily the Council) who set a higher standard at Chelsea year after year, up to which they are able to live.—ED.]

The lower part of the stream garden by Pulham and Son, with boulders of Cumberland stone

Irises at Chelsea

IT was to be expected that the late season would affect the Iris exhibits. The result is that certain sections that have never been fully represented at a Chelsea Show before, were present in force. In the rock gardens, as well as in groups in the tents, Iris primula, in many varieties, were in perfect condition. They ought to have been over weeks ago. When one looked for the varieties that are usually found at Chelsea, they were hard to find. R. Wallace and Co. evidently found difficulty in getting together enough that were sufficiently advanced to make a presentable show, but their Lilies were superb. Barr and Sons had a general collection including Primulas and some May flowering varieties. We noticed here also a fine group of the pretty little Iris cristata (see illustration), and a dainty group of the lovely I. Hoogiana. In fact, their collection of species and varieties was by far the most comprehensive in the show, and included representatives of almost every section. The Orpington Nursery Co. grouped a number of the late Bearded Irises among Silver Birches; amongst them being Wedgwood, a good yellow of moderate height called Gold Imperial, Shekinah, and some good blooms of Majestic. Near by Mr. Geo. Whitelegg had a group of various Irises, not named at the time we saw them. They were, however, mostly May flowering varieties, with a liberal sprinkling of bulbous varieties that were obviously forced.

When we turn from the exhibits of these specialists, all of whom are able, in happier seasons, to give us a good display at Chelsea, we were amazed at the success achieved by G. Bunyard and Co. in producing what was probably the finest collection of Tall Bearded Irises ever seen at Chelsea. Clean, well-grown, pure and clear in colour, with foliage betraying rude health, in wonderful variety, and effectively arranged; this firm produced three bold groups that were probably as near perfection as is ever likely to be obtained. All the favourites were there, and many others. Susan Bliss, which, under canvas, is a really beautiful pink, Sirius (a late purple bicolor), Magnifica (wonderfully grown), a pretty, fawn coloured flower with cold blue in the standards called Mira, Ambassadeur, Duke of Bedford, Luna, Morning Splendour, Marian Cran, Wayland Cowley, and many others. One bold flower attracted attention, Merope, a novelty, with Ambassadeur and Dominion blood in it apparently. The colouring is not vastly different from Ambassadeur, but the texture of the falls is velvety, the well formed standards are erect, and there is a firm, graceful poise about the standards that is absent in Ambassadeur; three flowers were open on one spike, and all in perfect condition. To those who want Ambassadeur colouring, with improved form, this Iris will appeal very strongly. We must compliment Messrs. Bunyard on overcoming the well-known difficulties of the season so magnificently and really rising above the occasion. Their exhibit was an example of how experience and courage can triumph over the most adverse conditions.

"Fairy Fern"

It was in the churchyard at Laleham, the last resting place of Matthew Arnold, that I first saw Helxine used to "keep memory green." This plant, which some call "Fairy Fern," grows very rapidly, and a tiny piece will quickly cover the soil of a large pot with delicate filigree work. Strangely enough, when it was used in the old Westminster Aquarium in 1906, at an exhibition, there was only one among the gardeners who knew it. Since then it has spread to thousands of homes throughout the country. If grown out of doors it will die back in the winter, but usually recovers in the spring unless the winter has been very severe. A moist, well-drained soil and a half-shady position are its modest requirements.—*Guild Gardener.*

Herbaceous Calceolarias

THERE are many more difficult plants than these to manage, which are overcome by our ardent amateurs. The month of June will see the majority of the plants on the wane, and as it takes nearly ten months to produce a flowering specimen seed should at once be sown; to hurry the plant is to court failure in whatever stage it may be practised, so that it behoves the cultivator to give them the coolest treatment possible, from the seedling state right up to the time they cease to be decorative. The hardier the plants are grown the better they withstand the winter frosts, a few degrees doing them no harm; fire heat and cold draughts should be avoided as much as possible, but abundance of fresh air on every favourable occasion is of vital importance to its welfare.

Iris cristata, a dainty species for the rock garden, with amethyst blue flow
shown by Barr and Sons

Pans not too shallow, as the compost is liable to dry up quickly at this date, is the best for the reception of the seed, carefully crocked and all well-washed previously, over these a thin layer of flaky leaf-soil or very thin turf, eventually filling to within ½ inch with about equal parts loam and leaf-mould, all passed through a ¼-inch sieve. Add enough rather fine sand to obtain porosity to the whole, pressing moderately firm with a level surface, and water a few times with a fine rose-can so that the compost gets uniformly moist throughout. In a couple of hours distribute the minute seed evenly over the surface, finishing off with a mere dusting of fine silver or river sand, finally covering the pan with a large slate or sheet of glass. Stand in a cool pit or frame, or even in the open at the foot of a north wall; in any event, the sun should not be allowed to play any part in the germination of the seeds or drying up the compost. When the tiny seedlings are seen to be coming through, gradually remove the covering to prevent
or elongation, and when water is

rot Begonias, Gloxinias, and Dahlias from seed

g flowers specially admired by the st, the above are firm favourites, like to dabble in raising seedlings of , but how many have the facilities? ow that Begonias, Gloxinias, and must all be raised in a heated green- he seed sown in January for the first d February for the other, if we want bloom in the first season. If one red to wait longer, the following is satisfactory: Some time during ent month the seeds may be sown in alf-full of small crocks, a layer of t above the drainage, and then about s of fine leaf mould, loam, and sand l parts. The Begonia and Gloxinia minute, water the surface of the he pan first, and after the water has away, scatter the seed evenly over st surface. To facilitate even distri- first mix the seed with a pinch of ersand and sow together; no covering from this is permissible. In sowing hlias, do not water the soil previously. kin the seed at 1 inch spaces all over n, and cover with about ½ inch of fine en water through a fine rose in the way.

seed pans may now be placed close eter in a frame, having a hard ash , and all covered with a square of sand opaque paper, in addition to the ight covering. In order to keep the rature as even as possible, the frame be matted up on cold nights. Watch ns closely, as on no account must the allowed to become dry. If, and when, is required, supply it by immersing the n a bucket of water, and when the e is seen damp all over, take out the pan very slowly to prevent suction and replace in the frame as before.

As soon as the plants appear—the Dahlias will come first—remove the glass and shade the frame from direct sun until the plants gain in strength, and when large enough to handle, prick them out in ordinary seed boxes, 2 inches apart for the Begonias and Gloxinias, and 3 inches for the Dahlias, using an ordinary mixture of loam, leaf mould, and sand, but rather rougher than that which was used for sowing. After pricking off, keep the plants close for a few days until they start growing away, and then admit a little air from the back of the frame, increasing this from time to time as growth proceeds.

The object is not to secure quick, but steady, strong growth, and for this reason the boxes may be propped up on inverted pots so that they will stand about 6 inches below the glass light of the frame. During the summer the lights may be removed altogether, and no further attention is required beyond seeing that moisture is supplied as necessary.

In the autumn allow the plants to die down in the boxes naturally, and we now have a stock of small tubers which can be stored away for the winter in sand, restarted easily in spring, and be assured of a brilliant display of colour throughout the following season.

TWO GOLD MEDAL GROUPS AT CHELSEA

Bunyard's Irises
Wallace's Lilies

Eranthemum pulchellum

The genus Eranthemum contains many gems well worthy of cultivation in the stove, but the above-mentioned species is considered one of the best for winter flowering. Eranthemum pulchellum may be termed a soft-wooded stove shrub. The flowers are borne in spike-like clusters of a bright, rich blue. Cuttings strike readily if taken in the spring and inserted singly in small 60-sized pots containing a sandy compost, and placed in a propagating case in a warm house. When these have become well rooted, pot on into 48's, using a compost of loam and leaf soil, with a free admixture of sharp silver sand. Place these in a temperature of from 60 degs. to 65 degs. on a bed of moist ashes, keeping the ashes well damped between the pots when showing signs of dryness. As these plants advance in size, and when the pots become well filled with roots, pot on finallly into 24's, using a similar compost, with a little well-decayed horse manure added. When well established in these pots, feed liberally with manure water, giving the pots an occasional dusting of Clay's Fertiliser about once a week, discontinuing this when the flowers begin to expand. After flowering, gradually withhold water, giving the plants a slight rest. Having been rested, they may be pruned back and repotted and grown on as large specimens for another year. I have known these plants to attain 15 inches to 20 inches in height, producing a wealth of rich blue flowers in winter, and often into spring.

E. B.

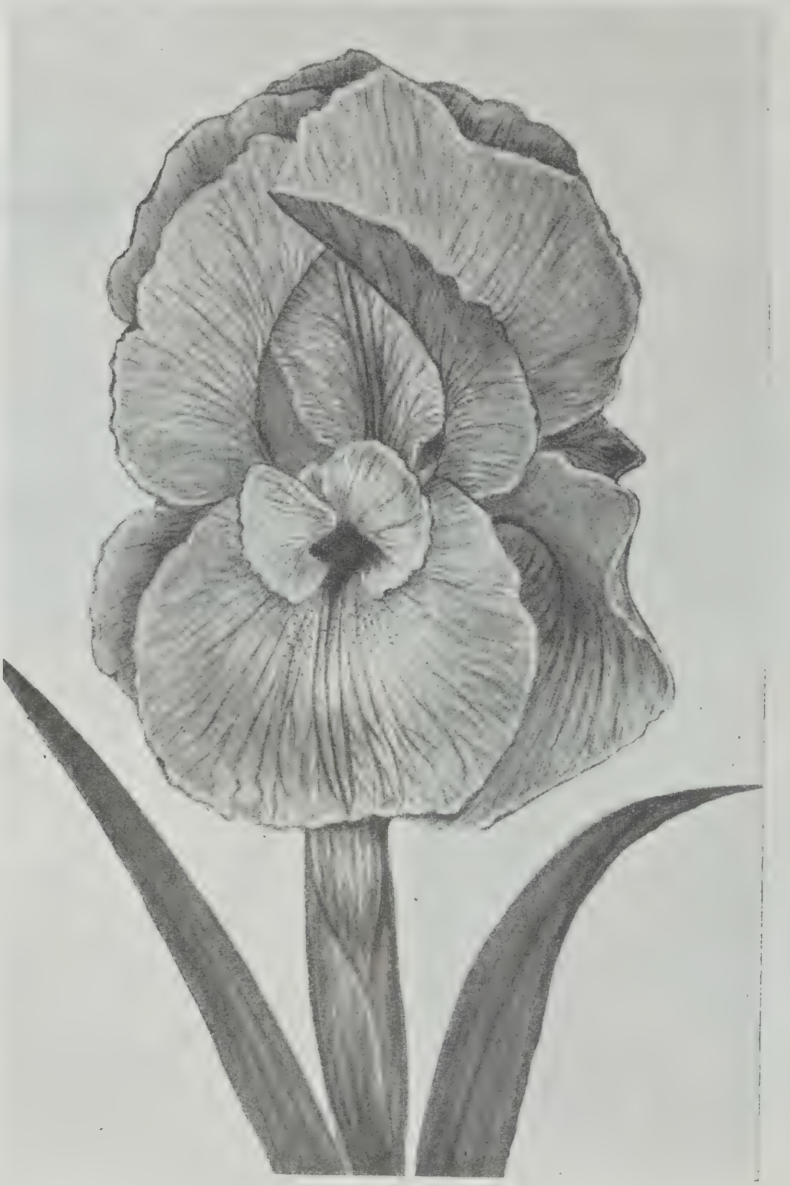
Waldsteinia trifolia

This is an admirable plant for shady parts of the rock garden in places where plant life is difficult to establish, or for the less important surfaces of the rock garden where a dense, spreading, sea-green carpet of leaves is desired. It will thrive with a modicum of soil, and even this need be only of the poorest character. It is also at home at the base of an old wall or by the margins of borders. The plant is unfit for prominent positions as it runs very quickly, but is useful as a carpet plant under trees, where its shoots may be conveniently shortened. It roots on the surface with great rapidity and may, therefore, be speedily propagated. Very small pieces put in the soil in spring soon form a rich verdure not more than 2 inches high.

H. Stevens.

The Cultivation of Asiatic Irises

IN "The Book of the Iris," by R. Irwin Lynch, for many years the curator of the University Botanic Gardens, Cambridge, there is a most useful and interesting chapter on the Oncocyclus section of Irises, especially contributed by the Rev. Henry Ewbank, who grew them with so much success at Ryde.



Iris Gatesii

He writes : "There are some things which you only have to stick in the ground and the rest follows with the utmost regularity—bud, blossom, fruit, are mere matters of course—the end may be taken for granted from the beginning, but this cannot be said with any truthfulness at all about the subject of these remarks." I would advise no one to waste time or money on these Irises who lives in a low-lying, wettish locality. A point to be insisted on is that these Irises should be grown in frames, or, at any rate, have shelter of some sort—not during the winter, but rather in the summer months. The reason for this is that soon after they have flowered, and much too soon for their own good, they will grow again. They come from hot, dry regions of the earth, and when they die down they are baked hard by the burning rays of the sun, and for long weeks and months together all chance of growth is denied to them. But this is the very thing which is best and most suitable to their case, for perfect root is enforced. Let us contrast this with what might happen in any ordinary year. Some passing thunderstorm and rain, which is so frequent in the summer, may flood the whole country round and through, soon afterwards the land may be dried up again—the Irises have began to grow and great harm is done to them. It is therefore necessary to put some covering over their heads soon after they have bloomed. I do not like the taking up system. Anyone who has seen the blossoms of these Irises which have come from plants that have been long seated in one place and others which have been taken from such as have been regularly moved would say at once : "I will never be contented with a make-shift and half-hearted sort of success. I will find out how to do the thing properly or will leave it alone." He quotes Sir Michael Foster, the greatest authority on the cultivation of these Irises, who states that "if the Oncocyclus are taken up and replanted somewhat early, the stimulus of the warm autumnal soil goads them into active growth so that t make up for lost time while they greenhouse shelf, and soon the co bruises and spoils them ; or, if pl the hand of winter is upon them have had time to anchor themsel roots, and frost thrusts them ground ; but if grown in frames t must be very good and ample given. I never, by any chance, d of a full current of air, but the protected from any torrents of rai

Mr. Ewbank continues : "Anot I follow in making these beds ve firm. When the compost for the been prepared it is thrown into and then beaten down with spac the force at our command, an should not be enough, the whole the beds is covered with thick bo get men to stamp on them and in compress the soil as much as poss we have done, the whole interior o is as hard and solid as a rock. which make their way in it are ir of being shifted. They have a anchorage as could be desired. what these creatures like, and le forgotten the rhizomes should neve covered. I say, again and agair only to be conquered by attentic things.

"And now to the turning poin thing—the question of soil which lately, thought to be of very triflin A friend of mine took into his he Oncocyclus Irises, and, as he about the difficulties of the task, first soil that came to his hand— was adding a wing to his house ar mortar and such-like were lying which he freely availed himself. flowering time came, I noted he succeeded and his Irises gave bet than mine with much less care. revelation indeed. I accordingly large sack of bone-meal and distr lbs. to the frame, which were 12 3 feet to $3\frac{1}{2}$ feet wide, and had a feet. The bone-meal was thoroug with the loam and the Irises plan autumn. During the following spring there were no sudden failure sequent disappearances.

"One year a terrible catastr pened. I was told that weak ma was highly beneficial. I repeated gardener and I do not quite know did, but I soon found Iris after Iri and my whole collection wiped out

"I felt I must give it all up, bu came to the point, Iris Lorteti, Ib Gatesii had thrown their spell ove set to work again as though no occurred ; and I can point to my pla are at this moment as strong and plants can be. This is the way in great change for good came about, I am concerned." Thus writes kindly and persistent of garden Henry Ewbank.

He tells us that for beauty h "these flowers distanced anythin had ever known," and goes on to r he was once on a Continental ra his wife : they arrived one evenin mecca of gardeners, Baden-Baden, permission to visit the Garden which was willingly granted magician" in charge (Herr Max Early the next morning our friend to the enclosure, which, he says, more floral treasures than any othe in Europe, and there found a very som of Iris Lorteti in the zenith of it

"I left the garden at once," h "and fetched my wife from the ho

When crushed the leaves emit tlr powerful, pleasant, and distinctive t. C. trichotomum is tolerably hardy, i effective as an isolated specimen or n grouped on the lawn or in the shrub The general appearance of the plant ledly handsome, a well-grown speci-aching 6 feet to 7 feet in height and g s much through. It grows well in a ained loamy soil.

Ralph E. Arnold.

Cyclamens from Seed

AMONGST the most beautiful flowering plants for small greenhouses are Cyclamens, and once their culture is understood they present no very great difficulty to the amateur with his small house and limited space. The most satisfactory way for a beginner to proceed is to regard them as subjects which should have about eighteen months' growth before blooming. In other words, to treat them almost as one does a biennial, by sowing seed in June for flowering in the winter of the following year. This is far better than attempting to hurry plants along in heat, which too frequently ends in failure.

Pans or boxes may be selected, being well crocked to ensure drainage and filled with a compost made up of old friable loam, two parts to one part of finely-sifted leaf-mould and coarse silver sand, the whole being thoroughly mixed. This should be made firm in the pan, and seeds sown 1 inch apart and covered about a quarter-of-an-inch with the compost or dibbled in. When this has been done, it is an advantage to place over the soil a thin layer of Cocoanut fibre to keep it moist. The pans may either be put within the propagator or in a warm part of the greenhouse where a heat of from 55 degs. to 65 degs. can be maintained. On seedlings appearing water must be administered carefully, just sufficient being given to ensure moisture, otherwise damping off of seedlings may take place. As soon as seedlings are well on the way, transplanting can be done; this may be into other pans or into small pots, using similar compost. Starting them off in separate small pots is, I think, the better way, but there is always a fear lest while in these small pots they should suffer from dryness at the roots and so receive a check. To guard against this, it is a good plan to deposit the pots in trays of finely sifted ashes or grit, which can be lifted on to shelves near the glass, a position it is desirable to give them, taking care, at the same time, that the young plants are shaded from bright sunshine. The first roots of Cyclamens are very thin and thread-like, and, unless great care is taken in shifting young plants, they are likely to be injured. The second roots, which are pushed from the base of the miniature tubers, are tougher, and so if transplanting is deferred for a time it is all to the good. Whilst the practised grower relies on sowing seed for his main stock of plants in the autumn, the beginner will find it more advantageous to make his sowing in June.

An even temperature in the neighbourhood of 60 degs., with a humid atmosphere, should be aimed at and maintained. Another point the tyro needs to watch is that, whenever Cyclamens are repotted, care must be taken not to cover the crowns, but to leave them quite clear of soil, otherwise damping off inevitably occurs. From a June sowing plants by the autumn will be ready for removal into $4\frac{1}{2}$-inch pots, and after this their winter quarters ought to be on a shelf not too far removed from the glass, or somewhere in the house where they will be unshaded by taller plants. Extremes of temperature must be avoided, and whilst air is needful, it should be given without exposing plants to cold currents of air, as from roof ventilators for example. By June or July of the following year, when frame quarters must be found for them, their final shift can take place. This may be into 5-inch or 6-inch pots for the most promising plants, and when established in these pots, occasional helps with weak liquid manure will improve both size and colour of flowers.

Though sowing has been suggested as being the best for the beginner, seed may be sown at almost any time of the year, so that in capable hands, one may have a show of flowers from September to May from successional sowings.

W. F.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

ALPINES

Abnormal Primrose

(C. H. Scoble).—It is possible that one, or more, of the seedlings would throw blooms similar to the parent plant, but if the plant is merely a sport, as you seem to think, the odds are in favour of all the progeny reverting to the original colour and form.

Primrose and Primula seeds and time of sowing

(S. M. M., Co. Cork).—Seeds of the former are offered by Messrs. Thompson and Morgan, seedsmen, Ipswich, who also offer a fine selection of Primulas. Mr. G. H. Dalrymple, Bartley Nurseries, Southampton, also makes a speciality of the latter and could probably supply what you require. The seed of both should be sown as soon as ripe, and this is generally about the end of June.

Dividing Primroses and Primulas

(S. M. M., Co. Cork).—These are best divided immediately they have ceased to bloom, as better crowns are then developed for next season's blooms. They may, nevertheless, be divided in autumn if this is inconvenient, but the results are never so good. If you decide to divide your plants now, it will be advisable to see that they do not suffer from lack of moisture for the first few weeks following transplanting.

Auriculas

(F. Smith).—1, Yes, Auriculas are Primulas; 2, yes, Auriculas are Alpines.

FLOWER GARDEN

Pæonies not flowering

(S. M. M., Co. Cork).—The Pæony loves a deep, rich and rather heavy soil which has been deeply dug or trenched and well enriched with manure, and this should be followed every autumn with a mulch of well-rotted manure. We suspect impoverishment as the cause of your plants not flowering, and suggest that you lift and, if necessary, divide those which fail to bloom either at the end of September or early in October—this being the best time to transplant Pæonies—preparing your land as above. It sometimes happens that a plant requires division after several years in one spot, and if properly done amply repays the trouble of doing it.

Tulips failing

(S. M. M., Co. Cork).—Your trouble is due to some pests with which your soil is infested. Lift and dry off the bulbs when the foliage begins to turn yellow, afterwards sorting out the best only for next year's planting. When dried and cleaned, dip the bulbs in a solution of permanganate of potash, and before replanting give your soil a dressing of Vaporite. Also we advise you to apply a dressing of fresh, slaked lime to your soil occasionally.

Double white Narcissus

(Mrs. M. Lane).—(1) This double form of the Poet's Narcissus loves abundant moisture and gentle shade, such as that furnished by thin summer-leafing trees, but not swampy, stagnant moisture. Every third or fourth year the bulbs should be lifted (that is on cultivated land, in the grass this is rarely necessary). This should be done in July, the bulbs being ripened in the sun, and later cleaned and sorted. The largest and best should then be planted on fresh, moist land, or any time before the end of September, planting them at 6 inches apart. It is quite a common occurrence for a percentage of this variety to come blind. (2) Either J. Waterer, Sons, and Crisp, Twyford, Berks; or Pearson and Sons, Lowdham, Notts, would supply you.

Lily of the Valley

(A. E. P.).—From the few faded and dried up stems sent, we are unable to give any opinion as to the cause of the trouble. You should have sent a whole plant—flowers, leaves, and roots—packed in damp Moss and enclosed in a tin box; and if you care to yet do this, we will be pleased to try and fix the cause of the unsatisfactory behaviour of this Lily of the Valley bed.

Heuchera Richardsonii

I shall be much obliged if you will kindly tell me the name of the enclosed flower and if it is quite hardy. It came up as a chance seedling amongst some Nemesias, I think, in a seed pan in the spring of 1927. The little leaves looked so pretty and interesting that I grew it on until it was finally potted in a 7-inch half pot, where it has lived ever since. In the winter the leaves turn reddish with the first cold weather, and during this last severe winter, when everything in my cold greenhouse froze solid in spite of oil lamps, and when everything like Geraniums, Fuchsias, Ferns, etc., perished entirely, this plant came through all right, only losing more of its leaves than it did last winter. I enclose two of last year's leaves, most of them are now dying, hanging round the sides of the pot, smothered by the luxuriant growth of new foliage.

There are about seven spikes of flowers, all except these two being well over a foot in height and having about 15 to 24 little blooms on each, rather widely spaced, as you will notice on those sent you. It makes a pretty and somewhat distinguished-looking pot plant, though the flowers are so quiet in colouring. A. C. B.

Stratford.

[The name of your plant is Heuchera Richardsonii. It is herbaceous and perfectly hardy. In the open, the tall spires of flowers are a reddish shade, and being about 2 feet in height, lend a graceful aspect to the plant. Its greatest beauty, however, is seen in autumn, when the large tufts of foliage turn a rich bronze shade.]

Sweet Peas and rotation

I saw in a recent issue that Sweet Peas should not be grown on the same ground over a number of years. I have a long, narrow border on purpose for them. (1) Is there any treatment which makes it possible to grow
them there continuously? (2) Wha
grow there, if not? I mean, woul
dwarf or runner, be all right? Or mu
non-leguminous plant? (3) For ho
years may Sweet Peas be grown,
many years should elapse before
them again? R

[(1) If it is imperative to have t
Peas on the same site, have the top
depth of 18 inches removed, and rep

antity of water required is made hot
sulphate added until no more will
; the solution is then applied with a paint brush to the whole aerial portions. If Mildew does appear, use sulphur applied by means of a "Sulphurator."

Peach Shot-Hole

(West Riding).—Your Peaches are attacked by the so-called Shot-Hole Fungus. This fungus attacks the foliage of many fruits, and forms small patches of discoloured tissue which bear spores. After a time, the diseased patches become dry and fall away from the tree, leaving the leaves with the appearance of having been riddled with shot. The wood and fruits are attacked at times. If your fruit is at the ripening stage you can do nothing for the moment, but as soon as you have cleared the fruit you might spray the tree with lime-sulphur solution at summer strength. Next winter, just before the buds begin to move, give a thorough spraying with Bordeaux Mixture, and when the leaves are expanding use a spray of dilute lime-sulphur, say, 1 pint added to 12 galls. of water. Repeat this at intervals. You say that, some time ago, the foliage began to drop. Now it is only in very severe cases of the above fungus that leaf drop occurs, and we suspect that some other organisms are the real cause of the leaf drop. Some of the leaves you send are badly infested with Red Spider, and this pest is a likely cause of the leaf drop. Keep plenty of water about the house and syringe the trees freely with water as soon as you have the fruit off. If you kept a crack of air on your house all night, it should help you to get over the difficulty of one end of the house getting too warm.

Apple trouble

(P. H., Guildford).—We have examined your specimens and can find no fungus present that would account for the failure of the flowers to develop. As a matter of fact, the trouble you describe is a very common one this season in certain districts, especially with Bramley's Seedling, and the cause in each case we have been able to investigate, is late frost. The form of damage seems to follow very closely the state of development in which the trees were when the frost occurred. If the trees were in the stage of unfolding the leaves around the fruit buds when the frost came, the fruit buds did not develop and eventually dropped off. If the trees had reached the pink bud stage when the frost came the stigmas were blackened, but the flowers opened normally and then dropped. Bramley's Seedling is, in all cases, rather slow to come into bearing, and this may account for the trees failing to produce fruit; this year frost is the cause.

Silver Leaf

(X. Y. Z.).—Yes, the trouble is Silver Leaf, and as you say the trees are young we should be inclined to leave them in position for a season to see if they recover. Keep a sharp look out for all dead wood, which should be removed and burnt. Give the trees a dressing of sulphate of potash at the rate of 1 oz. per sq. yard, and well water it in.

VEGETABLES

Cucumber failing

(A. M. T. Bewdley).—Your specimens arrived in a very dried up condition, but as far as we could ascertain, your trouble is due to a bad attack of Red Spider. Such a severe attack is usually due to cultural error, such as trying to grow the plants in too dry an atmosphere. If all your plants are in the condition of the one sent, you should fumigate the house with naphthalene and afterwards burn all the plants, and then make a fresh start. You would probably find "Commercial Cucumber Growing," by the Lea Valley correspondent of "The Fruit-Grower," obtainable from this office at 2s. 6d., postage 3d., helpful. If you require directions as to using naphthalene for fumigation please write us again.

MISCELLANEOUS

Couch Grass

(E. Williams).—We have no experience of the machine you mention, but doubt very much its efficacy in the case of the weed you call "Scutch Grass." We presume you refer to Couch Grass. This is one of the very worst weeds to control or eradicate. Probably the most certain procedure would be to dig out and remove the soil as far as the weeds extend and to the depth of a foot, or so, replacing with fresh, clean soil and clean turf, or sowing down with lawn grass seed. This, if the weeds have extended any considerable distance into the lawns, is rather a big job, but is really the only effective method for dealing with this trouble.

Use of lime sulphur

(Constant Reader).—We cannot be of much assistance to you because lime sulphur in powder form varies somewhat in composition, and it would be wise for you to get into touch with the firm who supplied the material and ask them for directions. The firm concerned will, no doubt, be pleased to assist you as to making up the material. It will now be too late to apply the material for a pre-blossom spray, but you should endeavour to get the spray on the trees so soon as the majority of the petals have dropped. If you delay spraying you will certainly get scabby fruits.

Stimulant for Asparagus, Aspidistra, Fern, and Palm

(S. O. A.).—(1) If given in moderation, sulphate of ammonia will benefit the plants named. (2) and (3) As the Asparagus rather likes lime, you need not be afraid to use the sulphate, and the Aspidistra is never in the least fastidious as to what the soil contains.

Lime-loving plants

(B.).—There is no hard and fast rule by which one can determine whether or no plants are lime-loving or not. Gardeners throughout many decades have made observations on the subject, and it is known definitely that some plants will not grow well in a soil which does not contain chalk. Nearly all the legumes are cases in point. Pinks, Carnations, Clematis, Lily of the Valley, Dogwood, Wayfaring Tree, and many others, are plants never happy away from chalk, but, of course, it is possible to grow all chalk-loving plants in a soil that is naturally devoid of lime by adding chalk or quicklime to the site prior to planting. There is another group of plants which do well on some chalk soil but not on others, but moisture is, in this case, the determining factor. Chalk soils are usually dry soils, and in districts of low rainfall many plants fail to obtain the necessary amount of water for growth, *e.g.*, Salix alba, Hypericum pulchrum, Stellaria holostea, and Galium saxatile grow freely upon the Vosges, where the soil is fairly retentive of moisture, but the plants are absent from the calcareous Jura mountains. Under garden conditions it is possible to grow moisture-loving plants upon chalk soils by adding organic matter to dry chalk soils so that moisture is retained. A third group of plants is known to gardeners, which detest lime and will not grow if chalk is present—Heaths, Rhododendrons, Azaleas, are examples. When it is desired to grow this class of plant on chalk soils, peat beds are made for the reception of the lime-haters. Broadly speaking, the separation of plants into lime-lovers and haters is fairly easy, but there are, of course, difficulties, *e.g.*, Liliums. Some Lilies are very tolerant of chalk, others will not grow if it is present.

NAMES OF PLANTS

E. Williamson, Leicester.—The Barren Strawberry (Waldsteinia trifoliata).

H. A. Collins, Dublin.—1, Spiræa arguta; 2, Rhodotypos kerrioides; 3, Pyrus halliana; 4, Prunus serrulata (Japanese Cherry).

G. F. S., Berks.—1, Melittis Melissophyllum album; 2, Epimedium alpinum; 3, Alyssum saxatile citrinum; 4, Primula Juliæ.

Meiktila.—1, Androsace sarmentosa; 2, Asperula tuberosa.

W. Ray.—The Tulip flower had fallen to pieces when it reached us and the petals had all become discoloured, so that is is impossible for us to even aim at the name.

W. R. Y., R. K. S.—1, Viburnum Carlesi; 2, Syringa vulgaris (Common Lilac).

Reigate.— Staphylea colchica (Colchican Bladder Nut).

L. G. G.—Jacobinia magnifica syn. Justicia carnea.

R. G.—Weigela (Diervilla) hybrida Eva Rathke.

V. B.—1, Kilmarnock Weeping Willow (Salix caprea pendula); 2, American Weeping Willow (Salix purpurea pendula).

E. F., Hereford.—1, Erodium corsicum; 2, Saxifraga decipiens grandiflora; 3, Saxifraga maweana.

An Anxious Reader.—Juniperus horizontalis (syn J. sabina var. prostrata).

W. A. W.—1, Tricuspidaria lanceolata; 2, Leptospermum Nicholli.

G., Dublin.—1, Libertia formosa; 2, Lonicera flava; 3, Ceanothus dentatus; 4, Rose, Single Yellow Banksian; 5, Rose, Yellow Banksian; 6, Asphodelus luteus; 7, Rosa rugosa alba; 8, Rose, Single Banksian; 9, flowers withered (probably R. rugosa); 10, Polemonium cœruleum; 11, Ribes cereum (probably); 12, Syringa Marie Legraye.

A. A. S., Dorset.—Clematis montana.

B., Devon.—1, Cercis Silquastrum (Judas Tree) (see note page 382); 2, Tulipa chrysantha (see note page 380).

Table Iris

In an article under the above heading, Mrs. E. A. S. Peckham tells us in the American Iris Society's Bulletin for April that Miss Sturtevant "has a set of really charming plants she is playing with that will come right into line for table decoration."

Also that Mr. Williamson, too, has a group, which, for cutting and arranging on the table, will be ideal.

The English Society's Schedule includes a class for "an exhibit to demonstrate the decorative value of Irises." As this class allows the exhibitor full scope as to bowls, vases, or baskets, and that the flowers need not be grown by the exhibitor, one will expect to see quite a number of exhibits for the Gordon-Lennox Challenge Trophy at the Show on Thursday of next week

Anemones at Truro

I see in your paper of May 18th, page 341, an article by "Peter the Hermit." I, too, was at Truro Show, and, although I know neither of the exhibitors, I think, in fairness to Mrs. Henderson-Bull, I would like to state the beautiful Anemones were exhibited by her and not by Miss L. Williams. MRS. D. M. YONGE.

In the time of Roses

"He who would have beautiful Roses in his garden must have beautiful Roses in his heart. He must love them well and always. He is loyal and devoted ever, in storm-fraught or in sunny days, not only the first on a summer's morning to gaze admiringly on golden charms, but the first when leaves fall and winds are chill to protect against cruel frost."

These words of the late Dean Hole, the doyen of the Rose-world of his day, are as true as when they were first penned. Never before has such interest been shown in this typical flower of an English garden; never were there more growers or more attention paid to its culture by all sorts and conditions of people. One wonders sometimes what the Dean would have said of the glorious varieties which are ours to-day, in comparison to the limited varieties of his time. How he would have revelled in the Hybrid Teas of modern introduction, while keeping a warm corner in his heart for varieties that have served us well, and are still regarded with favour. It will be within the recollection of some old Rose-growers that fifty years ago Teas were grown under glass in pots, and treated as too tender for outside culture, but the Dean upset that theory by growing Tea Roses out-of-doors at Caunton Manor. Those were the days when one heard more about Hybrid Perpetuals than one does now; when old-timers like John Hopper, Charles Lefebvre, Victor Verdier, Jules Margottin, and Baroness Rothschild figured on exhibition tables. The last, a big pink, was practically scentless, but its size gained for it a place at almost every show. To-day we have entered into a goodly heritage in Hybrid Teas, the colours of which are so delightful, and are more constant in their flowering than ever the old H.P.'s were. As I look at my Rose trees, I cannot help but think of the debt we owe to the old raisers for varieties which are valued in our time, such, for instance, as La France, Caroline Testout, noted for their vigour and free flowering. Very few of the varieties considered the cream in Dean Hole's days, however, are known now, but from some of them, no doubt, not a few of the present day varieties emanated. It is seldom, except in the southern counties of England, one comes across Marechal Niel grown out-of-doors, but as an indoor yellow, when well-grown, it has not an equal in point of colour and rich fragrance. Not only are we blessed with beautiful tinted varieties among Hybrid Teas, but what is of equal importance, modern raisers have given, and are giving, thought and consideration in the raising of new varieties that shall possess that other attribute, fragrance, without which the finest Rose is incomplete. In white Roses, would there be any to compare to Frau Karl Druschki, with its peerless purity, did it only possess the one thing which it lacks—scent? I think not. It is not surprising that the singles are gaining in popularity this year. One may use them in different ways in a garden, for bedding, for pillars, and pergolas and walls, and also for cutting for table decoration. W. F.

Capt. F. Kingdon Ward

Up to the time of going to press, no fresh news has been received of Capt. Kingdon Ward. About a week ago news was received that he was lying helplessly ill in a remote spot at Muong-Sing, Laus, Tonkin, with no Europeans within hundreds of miles.

Mrs. Kingdon Ward proposes to leave Croydon on June 4th by India air mail to join her husband.

Mr. Kingdon Ward was invited
Cambodia expedition organised
Roosevelt brothers. He reache
(China), turned south alone
bearers, and penetrated into difficu
tually unknown country. On
Muong-Sing he fell ill, and news
was brought through Burma.

It was Mr. Kingdon Ward who,
Cawdor on a Tibetan expedition
that the great Tibetan river and
maputra were one and the same
found and brought to England
plants, including Meconopsis,
Himalayan Rhododendrons, and ot
which have been introduced int
gardens. He has made many exp

The value of "SANITAS Powder"

is proved by experience

" (exact copy).

Hucknall, Notts.
8-5-29.

Sirs,

About four years ago I had a circular left here referring to your "SANITAS POWDER" as a good thing to use in the Garden, and so thought to give it a trial as we were pestered with sparrows and insects, eating and destroying the peas and small seeds. As an experiment I tried the various rows with it, and alternately without it, and I felt I must write you (after three successive years trial) to say, it is the best thing I have come across, and can assure you I would not be without it. I have recommended it to every garden holder I know ; and I may say I live in the midst of hundreds of allotments, and after trial I have been thanked over again, many times, some stating it has been worth its weight in gold, a statement (from personal use) I can endorse, I use it on nearly every seed and plant, roses included. Results always satisfactory You can refer anyone to me and I can assure you, they will be advised by me to try it, and they, if local, can see the results in my garden.

Yours, in grateful remembrance of circular,
(sd) S.T.A. "

Lawns

Graded Correctives

To obtain a perfect lawn, free from weeds, clover, etc., you must use our Graded Lawn Correctives. The mixtures are the result of extensive research and trials, and are graded according to the soil on which they are to be used. Send us a trial order together with a specimen of your lawn (2" x 2") and on the report of our Chemists a Corrective specially adapted to your soil will be forwarded.

Sweet Peas

Planting out, staking, and training

s many years since I have known et Pea plants to be so backward. se set out six weeks ago made little y until the last few days, since we ad a general soaking of warm rain. be a long time before the spring of 1929 otten; even in the warmest and most ed gardens unlimited damage has been It seems quite likely that the spring- plants will overtake those raised in this season. I usually cut my first about May 24th, but at the present e can do nothing lp them along han keep the soil erated by the use hoe between the

s quite possible nany seeds that own in the open February and have perished in il, and in those it would be ad- to purchase a r of plants at from a reliable and set them inches apart if arden decoration foot if required hibition or fine ms for cutting.

n planting out Peas it is essen- shake all the soil he roots and get heir whole length into the soil, if a g-pin has to be d to, as it is im- that the anchor in roots have a downward . Do not plant deeper than the collar, ess the soil well around them, after- giving a good watering to settle them r new quarters, and protect from slugs little old soot or lime.

e plants have not already been stopped them now and place a twiggy stick or round each. Many plants, no doubt, ere planted out early have damped off collar. There is no cure for this, and ants should be pulled up and burnt. I found this to happen in many cases the plants have been grown several in the same trench. This is bad policy ever leads to good results unless the r part at least, is changed each year. Sour soil and that deficient in lime also leads to this trouble.

Staking and after-treatment.—Staking is one matter which must be attended to when the plants have become established, and if these are being grown for garden decoration only. Hazel, Beech, or other ordinary Pea stakes will answer the purpose well, but these should be bushy and 6 feet to 8 feet in height. Place them close enough together to accommodate all lateral growths without crowding, and allow a little space at the top for the circulation of air.

If grown for large blooms a little more time and care is necessary, and there is nothing better than tapering Bamboo canes 8 feet or 10 feet in height. A strong post should be placed at either end of the rows on which cross-pieces should be fixed on which to fasten wires to keep the canes in position. These should be tied firmly with tarred twine. When fixing the cross-pieces it is best to allow the top one to be 6 inches or so shorter than the bottom one. A great many Sweet Pea growers now prefer to use special Pea netting in place of Bamboos, wire, and twine.

Tying the shoots to the canes should be commenced when large enough in the case of those trained on what is known as the cordon system. This must be done carefully without strangling the fragile shoots. Several side shoots will appear from the plants that have been stopped, and robust growers may have two or three taken up, whilst the weaker growers, such as many of the salmon and orange colours, should only have one. Choose the strongest as near the base as possible. When the plants are making good headway mulch them after a good soaking of rain. Do not use any form of stimulants until after the first blooms have opened, and do not give the plants dribblings of water. Spraying is an advantage after a hot day. W. E. Wright.

Powerscourt, one of the best of the lavender-coloured Sweet Peas

Notes of the Week

Gladioli from seed

A very interesting way of obtaining a collection of this glorious plant is to raise it from seed, but they will not flower until the following season. It is a system I can strongly recommend to amateurs, and if they obtain a good strain of seed some delightful surprises await them. More often than not, the finest spikes of flowers are obtained from seedlings.

Sow the seed thinly in well-drained 6-inch pots filled with equal parts of leaf-mould and loam with a little sand, and cover with a quarter of an inch of soil. If the pots are sunk to their rims in a slight hot-bed germination will be quick, but in the absence of a hot-bed place in the greenhouse. Carefully water and ventilate as soon as the seed germinates, and as the season advances remove the lights entirely. Throughout the season give liberal supplies of water, and as the foliage begins to ripen lessen the supplies gradually until finally withheld altogether.

The corms by the end of the season will be the size of Peas. Store the pots away in a cool, frost proof place until early April, when they should be sorted out and planted in a way similar as for older corms.

F. H.

Dryas octopetala

Dryas octopetala, the Mountain Avens, is a charming evergreen Alpine, neither new nor rare as a plant, but is rarely seen at its best, with its lovely Oak-like foliage spreading into a carpet several feet across and surmounted with a wealth of small, white, Strawberry-like flowers. A native plant, found occasionally in the limestone mountains of the North of England and more abundantly in Scotland, it likes a cool situation and is very partial to a chalk or limestone soil. Under cultivation it does not always get these essentials, and those planting it should choose a position amongst stone where a cool rooting medium is assured, and supply lime by adding lime-rubble to the compost if lime deficiency is suspected.

W. Auton.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Veronica (Hebe) Allani

A low, shrubby, and floriferous species from New Zealand, with grey leaves and white flowers. A pot plant of great beauty shown by Dr. A. H. Williams, Horsham, Sussex

The higher standard at Chelsea

YOUR correspondent "Garden Owner" (issue June 1st, page 385) has, perhaps, been somewhat severe in his criticism of the Council of the Royal Horticultural Society, but there is a stratum of truth underlying his rather too scathing remarks.

I am acquainted with many of the Society's exhibitors, both great and small, and have discussed things with them other than plants, and there is a feeling of irritation against the Council, particularly the amateur members, whom they say attend shows as if they were squires attending a village function. The staff are quick to reflect this attitude which results in tactlessness. If this were merely leading to the reprimand or dismissal of an official here and there it would be a matter of small moment, but it is giving birth to a more serious undercurrent of thought. There is a feeling amongst trade exhibitors that they would like to have a show of their own run by one of their own organisations. The idea is, as far as I can gather, still nebulous, but should it ever take concrete form enough to learn its own strength and possibilities the R.H.S. will have set up a serious rival to itself.

To-day we are all glad to see the increasing prosperity of the Society. To-morrow—the near or distant to-morrow—if it has such a serious rival as a trade combination it might find its star on the wane, for let it be remembered that R.H.S. prosperity is founded on the success of the Chelsea Show, and the Chelsea Show shorn of many of the best efforts of the horicultural trade would be a very different thing to the Chelsea of to-day when it has their willing, if sometimes resentful, co-operation.

This can be put right quite easily with the exercise of a tact that is not foreign to our race. The amateur members of the Council may be squires in their own villages, but in London they are small fry, and to "put on side," as the schoolboy would express it, causes irritation. It would not be amiss for the influential members of the Council to acquaint themselves with the outlook of the salaried executive towards trade members. It is always a mistake to offend men who know they can make or mar one's prosperity.

John Bull with a Trowel.

Tropæolum speciosum

Since sending you the note on the above, Mr. H. F. Smale, of the Castle Gardens, Warwick, informs me that plants growing in these gardens make growth 20 feet in length, and flower freely each season. The plants are growing in sandy loam and leaf-soil under clumps of Rhododendrons, hence the roots are in dense shade, the shoots c all over the plants. They are pla both east and south aspects, where ceive partial shade from nearby tree best roots were planted in 1900, sinc time they have gradually increased.

He concludes by saying that he thi secret why they flourish so well ther cause they are not disturbed and th receive ample supplies of moisture.

The last time I saw these plant three years ago (end of July), the covered in bloom, making a glorious against the dark green foliage of the dendrons.

Cæsalpinia japonica

The flowering of this beautiful an esting shrub is, unfortunately, a so rare treat unless it is in a few favoured with a mild climate and mu shine. It is quite hardy, but appar quires warmth and sunshine before set forth its racemes of canary-yell soms, each with a charming cluste anthers. These racemes are of La like form, but grow erect, and are in harmony with the bright green Ac leaves which are often 10 inches to in length. I retain pleasant memor fine specimen wreathing a west summer a mass of exquisite colour pregnant with interest. The shru loose, rambling habit, and produc shoots armed with formidable hoo spines. A well-drained loam soil w its requirements. C. japonica is cessfully placed upon a warm, sunn where, allowed to roam at will, i create a garden picture of great ch of unusual interest. Ralph E. A

Rose Rust

I am anxious to collect as much possible concerning the disease kn Rose Rust that is becoming rather amongst Roses. It usually makes pearance about the end of June, and the foliage on the underside. It ca be identified by its browny red an sooty spots, which have the effect of the leaf to die and fall. I shall b any of your readers who may hav attacked with the disease during t mer would be good enough to send men leaves. It would be very help if they would state, if possible, the which the Rose is budded, or w plants were obtained.

Courtney Page,

Exochorda grandiflora

ENCLOSED is a photograph of a bush of Exochorda grandiflora growing in South Devon. It was planted four years ago, when it was about 2 feet high. The picture does small justice to the beauty of the plant.

HARRY G. YOUNGER.

Bishopsteignton, South Devon.

A fine bush of Exoohorda grandiflora in a South Devon garden

This shrub, which is a native of North China, is now flowering in great freedom in many gardens

A succession of colour

It may interest some of your readers to hear of the happy effect of planting a long, narrow bed 20 feet by 2½ feet so as to produce blooms through the spring till the end of autumn, and requiring the minimum of trouble and attention. First, 12 good yellow Roses were planted, and between them good seedlings of varied Oriental Poppies. In the spaces remaining, double pink Tulips in groups of three were put in and the bed bordered with semi-dwarf Forget-me-nots. During April and May the Fern-like foliage of the Poppies made a perfect setting and support for the heavy heads of the Tulips, as big as Pæonies, and now they are over, the Poppies are bursting into bloom and the Rose trees are full of bud. In mid-April I filled the vacant spaces with Lobelia cardinalis and Border Carnations, which should carry on plenty of colour till the end of October. From time to time I remove a few of the lowest leaves of the Poppies to give light and air to the Rose trees and smaller plants, and give an occasional soaking in dry weather.

F. MORDAUNT.

Bournemouth West.

An old Elm, Hardwick Green, Bucks

THERE are some very fine Elms in different parts of England, and the patriarch in the photograph must in its prime have ranked among them. I am unable to state its age, for the oldest inhabitant does not recall any appreciative difference in its girth or its original height, as it snapped off in a gale some 30 years ago. But from the information received as to the distance reached in the fall it must have been close on 100 feet. There is still plenty of life in the old shell (for it is practically little else), as seen by the mass of frithy growth. It is just over 19 feet in girth at 3 feet from the ground.

E. B.

e ancient Elm at Hardwick Green, Bucks

Rose Mildew

This disease causes much trouble to Rose growers, especially to those who only grow a few plants. The fungus starts by forming greyish or whitish patches, generally on the undersides of the leaves. These spots of mildew gradually spread until all the young parts of the plant are diseased. Rose Mildew, if taken in time, is an easy fungus to kill, because the whole of the disease runs on the surface of the plant attacked, and it is therefore fairly easy to prepare a fungicide which will kill the fungus without injury to the host plant. Many fungi which cause plant disease live within their host plants, and then spraying can only be of use to prevent the spread of spores.

Most people fail to control mildew because they start too late. They forget that the amount of mildew present on the trees up to midsummer is so small that it is generally overlooked. After midsummer the amount of mildew shows considerable increase; it is then much more easily seen than killed. If Rose trees are sprayed with a protective wash as soon as the first sign of mildew appears, control is easy. The small powdery patches should be continually looked for, and, when detected, the Rose trees should be sprayed with the following:—Soft-soap, 3 ozs.; liver of sulphur, 1 oz.; water, 3 gallons. Stir the soft-soap into a little boiling water, and when dissolved add the liver of sulphur to the hot solution; stir well until the lumps are dissolved and then make up the mixture to 2 gallons with cold, soft water. The spraying should be repeated again 10 days later, and afterwards when necessary. Diseases cannot, as a rule, be stamped out by spraying once.

J.

Make your window sills brighter

Have you ever walked down a street in a busy town where some of the householders take a pride in the adornment of their window-sills with flowering and foliage plants, and noticed what an air of cheerfulness there is about them in comparison to houses where no such interest has been shown? That this phase of gardening is on the increase there is no doubt, and it is a healthy sign. I sometimes think that folk who show this interest in their homes give immense pleasure to garden-lovers who pass their doors. The outlay is really very trifling. Anyone can procure, or put together, a box to fit a window-ledge for a few pence and fill it with loam and a little leaf-mould and sand—a compost which suits most things—and the furnishing is not an expensive item either, supposing you cannot grow the plants yourself. Think of the plants which trail, like Ivy-leaved Geraniums, Campanulas, Nasturtiums, which bring masses of colour in the summer, of foliage plants like the golden netted Japanese Honeysuckle, and the white and green Nepeta Glechoma with its long, trailing shoots, or even for the season a plant of Asparagus Sprengeri, which does very well in a sunny aspect outside. Then one may have annuals like Mignonette, Candytuft, Virginian Stock, or a few plants of Snapdragons will set the sill ablaze with colour.

W. F.

"Chelsea" Show in 1950

TO those of us who have passed middle age nothing is more amusing than the exchange of remembrances as we walk around the show which we older gardeners still think of as "Chelsea." Though for 10 years it has been held in Hyde Park we cannot forget those days when we were content to struggle round the tented field at Chelsea in an atmosphere sometimes cold and often suffocating. How droll this now seems, our contented acceptance of weather conditions, dark tents, and packed humanity.

The great move was made by the Government's recognition of horticulture as one of the most stabilising elements of our national life and the passing of the Royal Parks Act of 1948.

Too long had our parks been regarded merely as "lungs" where fresh air might be inhaled and political air harmlessly expired. The great renaissance of floral beauty which from 1925 onwards swept forward at so great a pace led to the conception of parks as gardens, and finally public opinion brushed aside the inept limitations and established the Spring Show at Hyde Park as an event of greater importance than even the Academy, and gave the artist in flower creation an opportunity equal to his brother of the brush and easel.

The discovery of flexible glass soon put the dusky fabric of the tent into the past and enabled the flowers to be seen in a clear light which the adoption of sun-ray lamps placed a variable lighting at the disposal of exhibitors.

The public supply of fresh air drawn from the Surrey commons and delivered, cool or warmed, to the Metropolis as freely as the warm and cold water municipally supplied, made the temperature easily controllable. No longer did our Roses flag after a hot day and need replenishment, nor did our Orchid growers fear to bring their choicest plants to London under any weather conditions. In place of the disfiguring poles and ropes so necessary for the old-fashioned tent a light metal frame supported the flexible glass, and, thanks to Sprotfield's researches on the aluminium alloys, a girder of 50 feet in length weighed hardly as many pounds, and enabled the construction to be so light as to give an impression almost of open air.

Under such circumstances the crowded benches of Chelsea passed away and the garden aspect of the show was emphasised. No longer are exhibitors, like the builders of New York, obliged to pile their masses higher and higher for lack of ground space, all flowers are now seen as Nature intended, and we no longer look at Carnations and Roses rising in massive spires and arches far above our heads, nor see the dwarf Azaleas impossibly scale the walls or hang inverted from the ceilings.

One feature of the old Chelsea, the rock gardens, are no longer to be seen as after the fatal affray in 1946, when three Gold Medal artist designers were drowned in their own pools and the subsequent disappearance from the country of the Bronze Medal winners, this competition was cancelled for lack of entries. Fortunately, the veteran Superintendent of the Royal Parks, still mercifully spared to us, met the occasion by building the marvellous rockery in Kensington Gardens, where glens and vales of all kinds of stone, from the Jurassian to the lesser Oolite, now form a permanent memorial at once to his surpassing skill and to the memory of the ill-fated horticultural martyrs. To him also we owe the system of flexible and movable freezing pipes which in winter cover the Alpine parts of the rock garden, ensuring a winter covering of snow and the consequent success of Androsaces and other so-called "difficult" plants in the heart of London. Many rare plants, entirely collected from their native Alps, are now to be found flourishing in London, thanks to the pure air and matchless skill of their cultivators.

Perhaps nothing strikes us to-day so much as the naive satisfaction of the horticulturists of 20 years ago as to their progress in plant-raising. To read the journals of that day one cannot but detect an undercurrent of self-congratulation, a sense almost as of final achievement.

The Rhododendron specialists, for instance, spoke of their recent introductions as an accomplishment, but to us they seem but an unrealised beginning. What would the raisers of those days have thought of that magnificent series of hybrids between the Kurume Azaleas and the occidentalis group, which now light up every rock garden with golden fire? Or that wonderful series of late-flowering seedlings from R. discolor raised by Probst of Moldavia, which enrich our gardens in the summer and autumn months.

The Lilies, too, in 1930 had hardly been touched by the hybridist and the wonderful Superbum-Regale crosses from America and the lovely seedlings raised by Spirella, of Buenos Ayres, were unthought of by our forebears.

Again, the Japanese Quinces, which since their early introduction were but little worked upon, have in the last few years produced hundreds of new and marvellous improvements.

The Japanese Cherries retain their favoured position as spring-flowerin but their nomenclature still remains ject of controversy, as no plant has frequently made the subject of Mono

But among all the marvellous adv the last 30 years nothing is more than the increased art exercised in tural displays.

No longer do we see plants so crow the natural beauty of the flower an plant as a whole is sacrificed to a criminating mass of colour. The da 10-foot Delphinium is, happily, gone too, are the vast trumpets of the Da 1930. A new sense of balance, a line has replaced the rather gross tions of our fathers.

A finer sense of form and line has all spheres of art and the dusky hun the garden cubists, and the flicke decisions of the impressionists have their little day and passed into the bad jokes, forgotten and unsung.

In all this great advance the Min Horticulture has played a great part.

After the abandonment of armame the handing over of the World's Air to the League of Nations, the War O placed at the disposal of the new of Horticulture, and it was not long justified its existence. Gathering the greatest experts available it rapid the vacant rooms with its staff of D and Assistants, and the great accun of records is now the envy of the wh Service. It is even said the Dire Orchid Hybrid Records is pressing removal to the country for lack of sp with the Admiralty offices still va trust that this extreme step may be or at least postponed.

There are, of course, a few who reg horticulture should have become a ment of the State with the unavoidab duction of party politics that this n entails. They deprecate the free dist of seeds which has now become a lished practice. The Idealist party, offers of the latest Bi-generic Orch to its supporters, endeavour to out Realists with their wart-free Potat everyone over the age of 12.

Such objections raise a smile in u quarters, and the older among us member the much worse features days, when grants of actual cash we without any compulsion as to their d

The answer to all such cavillers magnificent show at Hyde Park. but the amazing energy and resourc Civil Service could have produced horticultural festival, and to its or and State-aided exhibitors must be g guerdon of praise and appreciation.

Flower gardens for children

IT is desirable, on many accounts, that children should cultivate flowers rather than fruits or vegetables. Most children are fond of flowers, and all can be taught to love them, and the hardier and commoner sorts, at least, do not tax the energies so heavily in cultivation as either fruits or vegetables. As children acquire strength and skill, they may gradually be entrusted with the care of vegetables or fruits, but they must be taught to use the products of their little gardens as a means of conferring happiness on others. But of all the lessons to be learned in a garden the most valuable is the art of observing; for so varied, so delicate, so minute, and yet so unerring are the operations of Nature, that though the closest study must fail to fathom her mysteries, the rewards of such study are so rich and so surprising that even the student of tender years is perpetually stimulated to fresh researches. This interest in natural objects, once awakened, will prove an inexhaustible source of pleasure. Flowers, however, form not the only study to be pursued in a garden. The sun, air, wind, rain and dew, birds, insects, the peculiarities of soil, all may be studied from Nature's ever-open, but too often unheeded, page.—March 22nd, 1879.

Primula chionantha

This beautiful Primrose is a n mountain pastures of the Chungtien in Yunnan, at an altitude of 12, above sea-level. This is the re anisodora comes from, but P. ch grows at a greater altitude than P. a at about 19,000 feet above sea level.

This is probably the most easily g the Nivalis section, and has long, leaves about 8 inches long, powdere lower surface with pale yellow me flower-stem is 12 inches to 18 inches is also covered with yellow mea creamy-white flowers are arranged i three whorls and, being borne on fa stalks, they have a dangling appeara thrives best in good fibrous loam an a shady, well-drained spot. This p biennial, but produces seed in gr fusion.

ıh was never named and is now
ıed) x pumila excelsa. This un-
rd seedling, however, had a very fine
r.ge and form, and its choice as a parent
een justified because, in addition to the
ıiful clear, almost luminous colour of
ıght, the form is quite outstanding and
n-kable. All were in flower from May
June 1st last year.

On giving and receiving plants

SOME time ago I was walking with a friend in her garden. To do that is one of the best pleasures in life, even if the garden is only an ordinary one; and this one claimed no special notice because of its modest pretensions. Naming a relation, my friend said: "——has what she calls a LOVE garden." The ring of an ecstatic note in her remark was sufficient to give an old bachelor reason to think furiously. In the pause which my friend might have filled with some explanation, my own mind pictured a sort of earthly paradise: joy and peace embowered in floral arbours; shaded walks beneath the spring verdure of various trees; grass under foot, and birds singing overhead. Quickly dismissing such vision of the setting appropriate for an amorous couple, I could only reply in the monosyllable "Why?" The answer was: "Because she devotes it entirely to plants given to her by friends." Another and very different vision came to mind—over which I will draw a veil. But I was led thus to think of the particular merit —or demerit—attaching to gifts of plants.

Considering the giver first: often many of us have had opportunity to know him well. In the progress of his gardening he comes across plants which have either done their duty to him or failed to do so, probably through no fault of their own. "Ah!" says Donor, "I will send these to old Hortus; he will be glad to have them, but if not, he can pass them on to his neighbour, Cultor." Well, this may be or may not be so. Delicacy of feeling may operate against the parcel being thrown onto the rubbish heap when it arrives, or the contents may include some much desired seedling or plant which, in new surroundings and under proper treatment, may flourish to the extent of making Donor say to himself on seeing it afterwards: "I was a fool to give that away." Yet Donor never gives of his best, of course. Do not blame him for that; to do so would display notable ignorance of human nature. But do not be too hard upon Donor. He, too, has to suffer and endure. Imagine him in his large and interesting garden showing, with pardonable pride, an uncommon variety of rock plants; attractive herbaceous borders and other rare and valued treasures, which give an equal pleasure to show or to see, upon which one or more of his guests—the "enthusiastic" are the most troublesome—will exclaim: "Oh! How lovely! Do give me a 'bit' of this—or that!"; a request repeated half a dozen times during the inspection. Poor Donor! He is thus bothered into giving or refusing to reduce his possession of much-prized plants or to part with "just a few of those bulbs." To comply might mean pulling about a symmetrical and well-grown drift or clump to gratify one who neither could, nor would, bestow proper treatment upon the gift. That has often happened. Of course, cuttings taken at the proper time need not involve a depreciation of beauty. (An expression of Donor's inmost feelings would be deleted by the Editor's blue pencil.) However, here is the counsel of perfection in the matter of giving worthily to a worthy recipient. (It may not be out of place to say that I have practised what I preach.) Make a note of the request, and if a present of the seed does not meet the case, as often

In the Cottian Alps

By Henry Correvon, of Geneva.

THE Cottian Range of the Alps is situated on the west side of Piedmont and forms the boundary between Italy and France, with the Monte Viso (10,000 feet high) as the highest peak. They go from the Col du Mont Cenis in the north to the Col d'Argentera in the south, and were famous in the time of Virgil for their herds of wild boars. The flora of the different valleys and of the rocks, pastures, and moraines of these Alps is very rich.

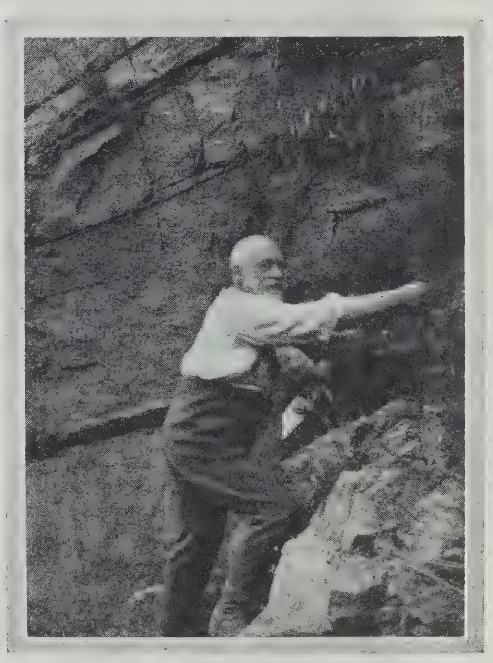
On the Italian side is the only place in Italy where the population is Protestant, and there the people speak French. The botanist, Dr. Rostan, in the last century studied the plants and published them through my countryman, E. Boissier. In my youth I made some interesting trips in that rich country with Rostan, and have published a monograph of these Alps in the Annual of the Swiss Alpine Club (1).

The most striking thing for gardeners is the sight of the Campanula Elatines on all the hard granitic rocks and walls, and spreading its branches against the wall, covering it very closely. It is the most exquisite of the rock Campanulas. Its long, spreading, brittle arms run out from the fat stock, bearing small Ivy, sharp-pointed leaves, gay green, sometimes downy, sometimes perfectly smooth. "The branches hug the rock and are set all over with a profusion of big, flat stars in a very deep tone of clear violet-blue," so speaks Farrer after having seen them near Torre Pellice. He says this species is far more elegant in growth and less leafy than its relative, C. garganica, and has larger and brilliantly coloured flowers carried on finer and daintier stems. Its nearer cousin is C. elatinoides, which I formerly found in the Bergamasc Alps, where it grows on chalk, always hidden in holes and under rocks, where the sun can reach it. This one is easier for us to grow here because of the lime of our water and soil. Another treasure of these Cottian Alps is the very curious and fine Campanula stenocodon, which is relatively easy to collect along the crest separating the Queyras Valley from the Piedmont, along the Col de la Croix both sides of the boundary, 3,000 feet to 4,500 feet in altitude. It is a strange little plant, with two or three very narrow hanging flowers in a deep violet-blue tube, in shape something between C. excisa and Waldsteiniana. Farrer, who saw it in the Roya Valley, says: "It is a fine thing, vigorous and elegant, having all the heartiness of the family and delighting in moraine."

Campanula Allionii is very abundant on the limestone débris and all over the crest. I once found, near the Lac Foréant, on the French side of the Monte Viso, the pure white form of it and brought it home. Transported in the garden, "Linnæa," near the Grand Saint Bernard Hospice, it grew well and gave us nice big flowers. Then came the war. I was unable to care for this garden, which I founded in 1889, and I gave it in 1917 to the University of Geneva, who created there a botanic garden institute and a laboratory, and the plant has been lost. Two years ago I went there in order to find the plant again, but could not find the place where I had left more than half of the tuft.

I spent then a few days in that Cottian country in order to pay a visit to my dear old Alpine garden, "The Rostania," situated at 3,000 feet elevation, above Torre Pellice. There, on a picturesque slope covered with Heath, Gentians, Dianthus neglectus, Seguieri, and sylvestris, Rhododendrons, Nigritella, etc., we consecrated in 1900 a nicely situated piece of ground, well watered and half wooded, as a botanic garden in honour of Dr. Rostan. There was a nice garden house and numerous rockeries planted according to the geographical distribution of plants. The war brought an end to the zeal of the professors and botanists of Pinerolo and Torre Pellice, and for 12 long years it was neglected. I was asked to pay a visit in order to restore the ruin. Some plants resisted the hard trial well, but the greater part died or were impeded by weeds. Curiously enough the Caucasian things resisted better than the other plants. We found some of them quite naturalised on the ground, while large tufts of Androsace sarmentosa, of Himalaya, had invaded the rocks.

This garden shall be restored, and we hope to have there a real collection of the local plants.



Henry Correvon seed collecting in the Alps

We went one day to the rock walls over the Germanasca, and found there carpets of Primula Cottia (Widmer). This plant is a cousin of Pr. villosa, of the East and the South Tyrol. It differs from its relative slightly. It seems to be intermediate between villosa and commutata, but the most curious thing is the far-separated habitat of the two, one being only found on the far east Alps and the other only here in the Cottian Alps. The leaves are covered with a brown down, and slightly dentate only on their top, which is round and very seldom acute. The teeth are large and obtuse; flowers 2-11 together on a glandular scape (10-25 in our garden in the Alps!), exceeding 1 inch diameter, bright pink with a tube much exceeding the calyx.

We then ascended the Col de la Croix, where the rare Saxifraga valdensis grows abundantly and looks very luxuriant. However, I never would root up any because this is its extreme south-east limit and the plant is rather common in the Mont Cenis regions. The Alsine lanceolata covers the hard limestone rocks and the Draba pyrenaica flowers and seeds richly on them. Sedum alsinæfolium, Arabis pedemontana,
neglectus, tener and sylvestris
Valdensium, Achillea Herba-Rota,

Lysichitum camtschatcense

LYSICHITUM CAMTSCHATCENSE is a native of N.E. Asia and N.W. America. In Asia it inhabits Eastern Siberia and the Kurile Islands southward to Central Japan, and in America it ranges from Alaska southward to California.

It is a mono-typic genus, a quite hardy plant, somewhat resembling the Skunk Cabbage (Symplocarpus fœtidus). It belongs to the Natural Order Araceæ.

Lysichitum camtschatcense is a stout glabrous, marsh herb with a creeping rootstock. The leaves are erect, 1 foot to 2½ feet long, sub-sessile, narrowing into a very stout, concave petiole. The spathe is from 4 inches to 6 inches long, erect, and is deeply boat-shaped, being pale yellow with dark spots marked regular over the inner surface, the spadix being stipulate and 4 inches to 6 inches long by ½ inch to ¾ inch in diameter, with a round top covered with green, dense flowers blooming from the base upwards.

The flowers are all fertile, and its scarlet fruit in its native habitat is said to be a favourite food of bears.

It is an excellent plant for growing in the marsh garden, where its bright yellow flowers stand out conspicuous during April and May before the leaves appear, the handsome leaves afterwards giving something of a tropical appearance. It grows freely from seed, which should not be allowed to become too dry, but are best sown at once in a moist position, and seedlings are generally freely produced around the old plant.

GEORGE H. PRESTON.

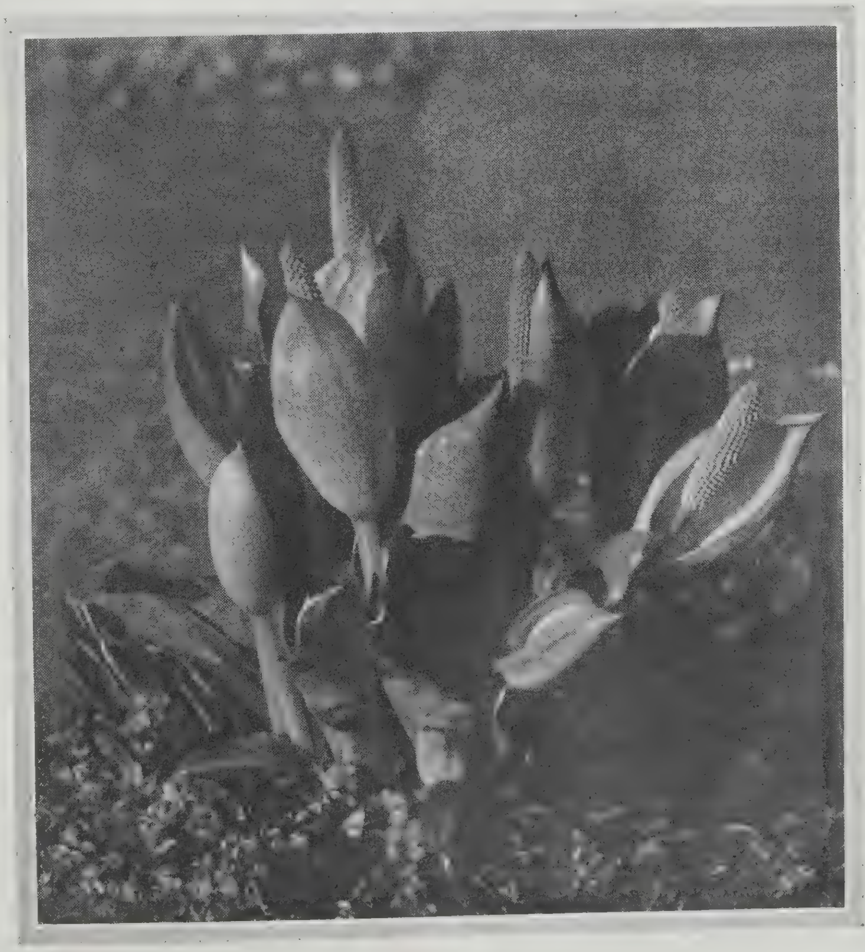
University Botanic Garden,
Cambridge.

Gunnera magellanica

A good many gardeners who know the giant Gunnera manicata or the lesser, but still tall and imposing, G. scabra or its variety major, are unaware of the existence of several miniature species, which deserve notice because of their singularly curious appearance. Those who have rock gardens with cool, moist, sheltered corners will appreciate the little Gunnera magellanica. There are some seven or eight other dwarf Gunneras, if not more, but few of these are in the market, and G. magellanica is offered by some hardy plant dealers. It is most useful for covering a bare spot with rounded, glossy leaves, with curious inflorescences of a ruddy brown which come in early summer. A sheltered spot is recommended, as, although it comes from the Island of Magellan, G. magellanica has not proved able to stand the vicissitudes of our climate in all districts of these islands. It transplants easily, and may still be planted. S. A.

Onosma albo-roseum

This pretty and distinctive plant is quite happy if placed upon a sun-kissed ledge with its roots in a deep and very gritty or stony loam. The hoary foliage is always attractive, while the drooping blossoms are ivory-white tipped with rose. The flowers appear in May and June, and last well. O. albo-roseum is easily increased by cuttings procured with a heel and inserted during summer in sandy soil in an unheated propagating case. The better-known O. tauricum, the Golden Drop, is a delightful plant for the rock garden or for the top of a dry wall. Its charms are better displayed when the plant is well elevated. RALPH E. ARNOLD.



Lysichitum camtschatcense in the Botanic Gardens, Cambridge

REMINDERS FOR THE WEEK

Southern and Midland

Perpetual-flowering Carnations

The young stock are now ready for a shift into their flowering-pots. Providing they have been gradually hardened off they may be stood on a bed of ashes in the open or in cold frames, the lights of which should be left off unless rainy weather should prove continuous, in which case it will be advisable to place the lights over the plants temporarily, as too sodden a state of the soil is undesirable. Stopping occasional shoots will be necessary from time to time during the present month.

Zonal Pelargoniums

The young plants which have been prepared for the furnishing of winter bloom must also be shifted into 5-inch and 6-inch pots, which should be well drained, clean, and sound. The compost should consist of turfy loam three parts to one part made up of seasoned leaf-mould, lime-rubble, and sand. The potting must be firm, and no artificial manure should be used at this stage. A cool frame will be found most suitable for these at present, the lights being drawn off during the daytime. Keep a sharp look-out for grubs.

Melons

As the ripening fruits are removed from the earliest house the latter should be washed down, walls lime-washed, and borders renewed in readiness for another batch of plants already prepared. The new borders should, however, be allowed to get thoroughly warm before the next batch is put out. Fertilise the flowers daily on those growing in cool houses and frames, and pay regular attention to the stopping, training, and thinning of the shoots.

Cucumbers

Do not allow Cucumbers to become overcrowded with growth or permit too heavy cropping unless the latter is to be of short duration. Brisk, moist temperatures are most essential to the welfare of both, and unless these conditions are maintained Red Spider and allied pests will prove troublesome and the crop suffer accordingly.

Ferns under glass

These very beautiful and desirable plants are now making growth freely, but no growth of any plant known to me is so quickly damaged if neglected, therefore maintain a warm and moist atmosphere, shade from bright sunshine until late afternoon, avoid dryness at the root at any time, and air the house cautiously whilst the growth is at this tender stage. If the paths and stages can be damped down in the evening after the sun's power has gone the colour of all will be greatly improved.

Bedding plants

Harden off late batches which for any reason have been delayed, and even fleshy-leaved Begonias and similar subjects which have been held back on account of hailstorms must now be planted out. Watering newly planted subjects will have to be a daily occupation until these have taken hold of the new soil, and this must be performed either in the late afternoon or early morning.

Dahlias

Slugs are very troublesome among these, and must be checked either by hand-picking or by frequent dustings of Slugicide or soot. Stakes should be fixed early and the shoots thinned to the desired number when 4 inches high. Young plants in pots should be planted out without delay, otherwise they will be late before coming into bloom. These must be protected from slugs for the first few weeks.

Potatoes

It is not advisable to earth up maincrop varieties until growth is strong and good, as hoeing is advisable for a time, and this must cease with the final earthing-up. Before the latter is carried out—especially on poor, light land—a dressing of Potato manure should be scattered over the surface.

Brussels Sprouts, Cauliflower, and Summer Cabbage

These sown in April are ready for planting out in large batches. The ground must be in good heart, although it is advisable not to overdo it with manure for the former, as this tends to rankness and consequent loss should the winter prove at all severe. Express is a splendid summer Cabbage of excellent quality, shape, and rapid maturity, and even with Peas and Beans in season is always a welcome dish.

Lettuces

Make use of the Celery ridges by sowing thereon lines of Lettuce in succession, and another crop which may be sown on such ridges is Endive, one line only along the centre, as it will not then be in the way when moulding up commences.

Growing crops

Keep the hoe going constantly among these as, by so doing, weeds are kept down, tracks of slugs and worms are broken, evaporation is prevented, and growth is vastly encouraged. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

The herbaceous borders

Growth is now very rapid among these hardy perennial plants and a considerable amount of time must be spent in staking and tying. It is always so much easier to carry out such work if it is attended to before the shoots get bent over.

Finish up bedding out

Even the most tender of the plants used in our flower-beds during the summer should now be quite safe if planted in their flowering positions. If the matter be unduly delayed the plants are apt to suffer from starvation in the pots or boxes, and these, when eventually planted out, very often refuse to take kindly to the soil.

When bedding is finished

There is always a considerable amount of débris left lying about after the annual bedding-out spurt, and until this is all cleared away it can hardly be said that the bedding is really finished. It is, of course, always wise to retain a number of plants of each kind in case of losses among the occupants of the beds. Having secured these, all pots, boxes, etc., should be collected and the boxes emptied, scraped, and set out to dry previous to storing under cover. Pots should be stacked ready for washing during bad weather, and all loose soil collected together and laid aside for future use, it being of value for mixing with fresh soil when the autumn propagation begins.

Dividing Polyanthuses

While it is, usually, better to raise these charming plants from seed, it sometimes happens that a few of the old plants may have produced flowers of extra
form, or pleasing colour, so the o
increase such is by means of di

"A debatable advance"

THAT the present enthusiasm in rock gardening is sufficiently widespread to be impressive is obvious; that it has by no means reached its zenith is equally clear; that it represents the most rapid rise in popularity of any "new" branch of horticulture is no exaggeration.

To describe the movement as a "fashion," akin, say, to "carpet bedding" or "crazy paving," is beside the mark and hardly to give it its due. Whereas a "fashion," horticulturally speaking, entails merely a fresh use of material already so familiar as to be almost stereotyped in application, rock gardening indicates the introduction to our gardens of a feature at once novel, educative, artistic, and experimental. As such, the prevailing enthusiasm is wholly to be commended.

Large trusses of bloom on Rhododendrons

Many readers record trusses of unusual size on Rhododendrons this year. The above illustration shows Pink Pearl among other varieties in the Rhododendron dell at Northwyke, Rustball, near Tunbridge Wells

One result which might legitimately be expected from this ever-increasing popularity is that it should be accompanied by a real and general advance in knowledge, and more especially in its practical application.

To the casual observer, no doubt, it is, There are rockeries and rock gardens everywhere. As compared with the "Almond cakes" and "dogs' graveyards" of earlier days they are delightful. Everyone is growing, or trying to grow, under conditions more or less approximately natural, plants they have never grown before, and to these additions are continually being made. Our gardens display masses of bloom and colour of which at one time we never dreamed. An interest has been awakened which is quite new to our experience; to the casual observer, indeed, the prevalent enthusiasm is contemporary with an advance which is altogether satisfactory.

But a more intimate acquaintance with rock gardens in general may well lead one to ask whether this is wholly true. The season when so many alterations to existing gardens and the construction of new ones are contemplated brings one up abruptly against the question.

As one who has abundant opportunity for close observation, the writer doubts whether this popular movement is always attended by the best results, whether the enthusiasm itself is not the cause of certain misdirections which render the advance less real than apparent. If a large number of rock gardens and rockeries are excellent in conception, construction and cultural results, at least an equal number are distinctly disappointing.

It can hardly be denied that, in the case of the majority, the really small rock gardens, all too often is there evidence of discretion being quite secondary to impulse. Were this not so such outstanding defects as utter unsuitability of site, incongruity to surroundings, superabundance of stone, and such misguided essays as the attempt to construct, say, a towering cliff from insignificant material, with all their attendant and eventual disappointments and failures, would be far less common than they are.

How often do rock gardens of all sizes betray most obviously the fact that it is the stonework which matters first and foremost, not so much as regards correct and natural placing of the individual stone, but as regards chiefly the effort to produce something of which the stonework is pre-eminently beautiful, of paramount importance, and calculated to be the leading feature. No doubt much of the work of experts, as seen at the great shows and in extensive gardens, is in every way admirable. But should this be the point which leaves, as it frequently does, the first and most lasting impression upon the general enthusiast? There seems to be but little regard shown by both teacher and pupil, expert and novice, for the simple but fundamental truth that Nature in this direction errs always on the side of modesty, and that the *primary function* of rock gardening is *not* the production of a striking and ornate edifice of stone, however natural, *but* the provision of suitable and congenial conditions for the plants, approximating as nearly as possible to those of their natural habitats. The result of this misconception is that the enthusiast is led to erect something which eventually takes him further from, rather than nearer to, Nature, to overlook the plain truth that nothing is ornamental which is not natural, and to devise and construct something of which the predominant and all-important feature is stone.

Apart from the necessary and quite legitimate element of competition there would appear to be at least two other outstanding purposes of the exhibition of " model " or ideal rock gardens at our great shows, viz., the demonstration of what can be done and how to do it. Such exhibitions have, as it were, a missionary responsibility, and to succeed in this they must cater for all classes. Can it be said, however, that the average small rock gardener or prospective enthusiast who attends the shows in his thousands is able really to gain much help from what he sees? Are not the " small " enthusiasts, at least, rather more likely to be led astray, not so much in ideals as in the presentation of them, and to retrogression rather than true advance by what is set before them? This is suggested most clearly, perhaps, by the fact that, in nine out of ten small rock gardens, the conception is far too ambitious for the scope and space available. An elaborate representation, in detail, of a whole landscape in miniature may be admirable in design and construction where space and scope are adequate, but it must be both futile and incongruous in the limits of the really small rock garden and rockery of the majority. May not one suggest, therefore, that a step in the right direction would be the inclusion in the schedules of our leading shows of a class in which the experts might demonstrate what can be done and how it should be done in the way of really small rock gardens and simple rockeries? Such a step could hardly fail to be mutually profitable.

Another most noticeable defect in numerous rock gardens of modest dimensions is the incongruity of the work to the immediate surroundings. Granted that, frequently, space available leaves little choice, yet in not a few instances the best site in this regard, and which is available, is overlooked, while in others this important point seems to be given no attention whatsoever. Here, again, the otherwise magnificent examples of the rock gardener's art fail when it comes to the point of being in any great degree practically helpful to those contemplating construction, in that such exhibits are, and must of necessity be, detached from particular environment, or, rather, are staged wich no environment at all. The more practised observer, of course, allows for this in forming his estimate of them, but the novice merely becomes obsessed with their superlative excellence in their isolated detachment, and concludes that they have only to be transported to one's garden for its further adornment, whereas if the truth were realised, many such exhibits would lose tremendously in effect and success unless placed in the environment their character exactly required. In passing, one might reasonably suggest that, were it possible, a far more equitable and satisfactory judgment in making awards for such exhibits might be obtained if the competition were confined to rock gardens actually constructed by the respective firms or individuals for their customers during a previous fixed period, say, 12 months. The importance of environment would thus be demonstrated and taken into consideration in deciding upon comparative merits.

There may be said to be two groups of " teachers " of this horticultural art, the expert and practical, represented by owners, designers, and constructors of rock gardens, and the theoretical, which latter may well include all who write upon the subject. It is probable that many more prospective enthusiasts are directed and influenced by them than by the former. The text-book and the periodical are the modest gardener's usual guide, and no doubt much that he gleans from this source is right and good. But to the writer it has always appeared that a great deal of the help thus proffered to deners is negatived by the fact tha the chapters, and articles on this particular, habitually and considera *estimate the skill and patience ne* such work. How often, for exam taken for granted that anyone, aft the advice given, may, with no trou more ado, construct a garden o forthwith, when the truth is that t of horticulture calls for more skill, ingenuity, and practice than any oth an assumption is aggravated ra alleviated by the further error of as is generally so in writings on th that small rock gardens and simple are equally as easy, if not easier, to to build than the most ambitious prehensive. One only needs a f and a heap of earth, and the thin so to speak. But anyone who has hand will soon discover that the g space and scope, the easier will be and construction, and that, the s design, the more the skill and ing manded. While one may, indeed, excellent miniature rockery capable wonderful results in a corner of the den, such an undertaking is not th a moment, or of a moment's tho demands a degree of skill out of a tion to its extent.

Rock gardening to-day has, for a of its rapid rise in popularity, to " small " man, the enthusiast o means and scope. It is, very large thusiasm which warrants the " which, to the casual observer, is so But, in view of the results of this en often unsuccessful, sometimes un rarely ideal, it is debatable whethe vance is so real, so unqualified as i In the writer's considered opinio sponsibility for this sense of false sa so to speak, lies fairly equally betw whose business and desire it is to those whose zeal is to learn. Until readjustment on such points as h noticed the " small " man must, to extent, remain " out in the cold," to himself, his efforts unworthy o tense enthusiasm which is their imp

Naming plants—*Readers who wish be named should send fair examples of stem, leaf, flower, or fruit. (Snippets and points of shoots are useless.) Not four plants should be sent in any one w same correspondent. Where more than is sent they should be numbered. Of co cones should always be sent.*

FRUIT

Pear trees not fruiting

(J. A. W., Bristol).—It would have been of assistance in tracing the reason of the refusal of the Pear trees to fruit had you said whether they are on the Quince stock or on the Free stock. If they are on the latter the trees will be late in coming into profit—if on the Quince they ought now to be bearing. As you say they are in good health and growing well, the chances are that your trees are on the Free (that is, the Wild Pear) stock, and you may have to exercise patience yet a year or two—remembering the old saw which was common before the Quince was generally used for a stock for Pear trees: " He who plants Pears, plants for his heirs." In your western climate the varieties you name ought to succeed; but they reliable when they can be given w Please write again at a later date cate how, or if, you prune the tree the same remarks apply to your Ap It appears to be the case that they a Crab stock, and, on this stock, the slow to come into profit. But wh begin to bear it will continue to b after trees on the Paradise stock ar exhausted. Patience and contin treatment are also likely, in this cas results—probably very soon.

Vine Red Spider

(J. E. S.).—The presence of Red Spider on Vines is an indication that water for damping down has not been used in sufficient quantities. Apart from the control of Red Spider, Vines do not do well in a dry atmosphere; it seems to us likely that the dry conditions of house, border, and the attack of Red Spider have all contributed to make your Vine foliage turn yellow. "Volck" is a very efficient pest control. We advise you to try the material and also to ensure the atmosphere of the house is kept humid, giving the outside border a good soaking if it is necessary. We are incubating your Antirrhinum material and will reply in an early issue.

Pear trouble

(G. B. M.).—Your Pear is affected with Pear Leaf Blister Mite, Eriophyes pyri. The mites spend the winter under the outer scales of the buds. In spring they pass to the leaves and burrow under the surface and blisters are formed. The females lay eggs beneath the blisters and the young feed there for a time, but later they eat their way out and burrow in a new position. Before leaf fall occurs they move to their winter quarters. At Wye, Prof. Theobald found that a lime sulphur-caustic soda wash applied in November and February gave a good control; his formula was lime sulphur made up according to the maker's directions, plus 1 lb. of caustic soda and 1 lb. of soft soap to each 10 galls. of wash.

VEGETABLES

Peas dying when about 3 inches high

(E. F. Paulii).—As we cannot trace anything either upon leaves or roots of those sent we suspect the Pea seed Weevil as being reponsible for your present trouble. This pest feeds on the seeds and roots of Peas during their sojourn in the ground, and when they emerge as perfect beetles transfer their attentions to the leaves, which, in bad cases, they eat right away to the midribs. Good, deep, and rich cultivation in the early stages of the crop is helpful as this pushes the plants past the stage at which they are generally attacked more rapidly. Frequent damping down of the plants and dustings of soot and lime will also act as a preventative; but, in future, any land which you intend to devote to Pea growing should receive a dressing of gas lime during the winter, this will account for any larvæ left in the soil.

Mushrooms in frame

(Inquirer).—It would certainly be possible to grow Mushrooms in a frame during summer, but the details of culture are numerous. The old manure would be of little use for this purpose. Might we suggest that you procure a practical little treatise on the subject of Mushroom-growing, entitled "Mushroom Culture," by W. J. May. It may be had post free for 1s. 9d. from Messrs. Barr and Sons, King Street, Covent Garden, London, W.C. 2.

ALPINES

Reducing the size of rock plants

I have large clumps of Alyssum, Mossy Saxifraga, and Dianthus on my rockery, and I want to reduce them in size. What is the best time of year to do this? Would it be better to dig them all up and buy new plants in the autumn? At present they are smothering plants of smaller growth.

AMATEUR.

[As the plants are already smothering others of smaller growth it would probably be advisable to pull them up altogether and replace with young stock in the autumn. If you care to do so, however, you could cut both the Alyssum and Dianthus hard back immediately after flowering to within a few inches of their base. Young shoots would then develop and the plants could be moved in October with safety. If you have room to do so open out the centre of the Saxifrage, even by removing a portion of the central growth, and fill in with sharp, gritty soil, bringing the latter well up towards the ends of the growths and making it tolerably firm. A large portion of the shoots will take root and can be transplanted in autumn.]

Wireworm in rock garden

Our garden here was old grass land and we are having a terrible time in the rock garden from the ravages of wireworms. Before the garden was planted we dug in a quantity of naphthalene; in fact, the soil smells of it. Unfortunately this is not effective and we are losing our plants wholesale. We are setting traps, Carrots, etc., but, of course, this is a slow process.

Can you suggest a cure? It does not matter if the places dressed have to lie fallow for a month or so. W. E. P.

[It is very difficult to clear badly-infested ground, and there does not appear to be any swift and certain method for getting rid of the pests. Frequently forking the soil to a depth of several inches will bring many wireworms to the surface, where birds will find and devour them. It is said that to sow land with mustard, digging in the crop when 6 inches or 7 inches high, is distasteful to these pests. If one could do without the ground for some months, a generous dressing of salt destroys numbers of them.]

ROSES

Rose suckers

Among some Roses which I bought early this year one, a bush of Hadley, is behaving rather strangely. It was cut to within 2 inches of the ground at pruning time, and from one of the stumps, but well above the soil, has appeared an obvious sucker with pale green leaves each with seven leaflets. The young growth of Hadley is red. I have rubbed out the sucker, but should like to know how I can prevent further suckers growing from the same stump. Is it not unusual for suckers to appear above the junction of the stock and scion? N. L. C.

[The sucker cannot really have sprung above the union unless the stock has not been cut back properly, and a dormant eye on that has sprung to life. Examine the plant closely, and if it is as we imagine you can cut away that part of the stock that is causing the trouble.]

Rose shoots

(A. E. Cook).—Your Rose bush is evidently dying, but what the cause is it is difficult to say without fuller knowledge of its condition when planted and its treatment since. It is possible that the roots have been in contact with some strong manure, the Rose, although a gross feeder, greatly resenting having this material near the roots at planting time. Dryness, too, might be accountable, or the roots may have been damaged when being lifted.

Rose Black Spot

(Joseph Priest).—Your Rose is affected with Black Spot caused by the fungus Actinonema rosæ. The leaves attacked show black or purplish areas, and in mild cases the disease does not progress beyond this stage. The fungus usually invades the whole leaf and the attacked leaves drop off early and the plant is weakened by the early defoliation. In addition to the leaves the young wood is often attacked. All leaves should be collected from the ground and burned both during the summer and at leaf fall; all diseased wood should be cut away. After the tree begins to break, a weak solution of sulphide of potassium should be used occasionally as a preventative. We do not feel easy that the Black Spot is the cause of the flowers being of poor quality. The leaves you sent are badly attacked with Red Spider, and it is probable that this pest is the cause of most of your trouble. You should keep plenty of water about the house and the Rose should be syringed on all favourable occasions. The potassium sulphide spray will help you with the control of spider.

TREES AND SHRUBS

Euonymus cuttings

(" Euonymus Only ").—There are at least two golden varieties, E. japonicus aureus-marginatus and E. j. latifolius-aureus. E. j. radicans is a dwarf shrub with several sub-varieties having variegated foliage. Cuttings should be inserted in early autumn in very sandy soil on a shady border. We cannot discover any nurseryman who offers cuttings of these shrubs, but any dealers would most probably be able to procure them for you. We are unable to say how the authorities at Kew would view an application for these.

Rhododendron leaves damaged

(G. Esdailo).—The shoots sent have been damaged by the late hard winter, but they do not appear to be thriving too well. A mulch of leaf-mould and manure over the roots would help matters, most probably. The Rhododendron, as a rule, requires no pruning, but any straggly branch that may be destroying the balance of the bush can be cut back. Probably " Rhododendrons for Amateurs," by E. H. M. Cox, would suit your requirements. It may be had post free for 5s. 4d. from Foyles, Ltd., 121, Charing Cross Road, W.C. 2.

Oak growth

(W. A. Cannon).—The growth you send for examination is that of the so-called " Cotton Gall " which is caused by the larval stage of a Hymenopterous Fly, namely Andricus ramuli. The gall is not uncommon in the South of England. The adult flies appear in July and are reddish yellow. In the male the upper part of the abdomen is black, but is brown in the female. Andricus ramuli, like many other of the gall forming insects, has alternating generations. The form you send, as noted above, gives rise to males and females in July. The females lay eggs later on the Oak, and galls are formed which are quite different to the Cotton Gall. The Autumn Galls are round with a depression at the apex; the gall is fully grown in October and falls to the ground. The larvæ remain within the gall for about eighteen months. At the end of this period the flies emerge and are all females. Eggs by this generation produce the Cotton Gall.

Transplanting trees

I have purchased two Copper Beech and one Cedrus atlantica glauca (all the same age, about 20 years old). The conditions are that I move them and take all risks. It is not a nurseryman that I have purchased them from. Will you advise me, please, if I shall be correct with all three in digging a trench round now, so as to cut some of the roots, and filling up again; and whether I transplant the Cedar as well as the Beech in the autumn? G. KIPLING.

[We think it would be very unwise to begin tinkering about the roots of trees of that size during the height of summer. Had you done so in February, it would have been all right. We suppose you will understand that trees of that age should be lifted with a large ball of earth attached to the roots? It would be better to defer moving the Cedar till February.]

Blue colouring of Hydrangeas

(O., Southport).—The particular blue shade which is sought after is not natural to the Hydrangea, and therefore must be artificially developed. Ammoniated alum is sometimes used at the rate of 1 oz. to a gallon of water, the plants being watered with this mixture. A more reliable method is to use Hydrangea Colorant at the rate of 2 lbs. to each barrowload of soil when potting the plants, and watering throughout the growing season (at least once each week) with the same Colorant, using 3 ozs. dissolved in 2 gallons of water. Hydrangea Colorant is offered by Messrs. J. Bentley, Barrow-on-Humber, Lincolnshire, and is sold in 3-lb. packets, sufficient to make 32 gallons, the price being 3s.

FLOWER GARDEN

Diseased Iris

(Hornchurch).—From your description we think that your Iris are affected with Soft Rot which is caused by a bacterium. Your best plan would be to take up the whole of your affected plants and cut away and burn all the diseased portions. Pay special attention to scraping away all dead rootlets. The rhizomes should then be steeped in a 2 per cent. solution of formalin for four hours and then replanted in fresh soil. It would be a wise precaution to prepare the new site by sterilizing the soil with a 2 per cent. solution of formalin 14 days prior to planting. The soil should be well forked over to allow the fumes of the formalin to escape before the rhizomes are planted. As soon as the replanted Iris get away nicely give a soaking with Cheshunt Compound.

Iris not flowering

I have a small clump of Iris named Iris King. The plants look healthy and continue to spread, but never have any flowers. Do they need any particular treatment, as I have had them four or five years now? They are in full sun. CLAY.

[Iris King belongs to the variegata section of Flag Irises and must have a good amount of lime in the soil. It is also benefited in spring by having a dressing of superphosphate of lime. Use at the rate of two ounces per square yard. These Irises dislike stable manure, so this material must not be used in their culture. Deep planting is, at times, the cause of non-flowering.]

Phloxes curling up

The Phloxes in my garden are attacked each year in the same way, shoots curling up and withering, and stem swollen. I am told it is due to an eelworm, but no one suggests a remedy. Can you recommend anything? Are any Phloxes immune from the disease? R. F. S.

[It is not very easy to get rid of these pests while plants are on the ground. Probably the best thing to do would be, even yet, to lift the plants, replanting on fresh ground that has been given a good dressing of lime, while the place vacated should have a good dressing of one of the soil fumigants dug into it at once. After replanting, the Phloxes should be well watered and some method of shading them from the sun adopted until they get established.]

Will Scarlett Daffodil

(M. E. M. Wilson).—We have examined the specimen bulb sent and can find nothing that indicates that it is in any way diseased, and we have concluded that the early ripening of the foliage is due to the dry season. It is not wise to leave the seed pods on Daffodils unless seed is desired because the formation of seed takes a good deal out of the bulbs and this alone causes early ripening of the foliage. We do not think you have anything to worry about. Please note that
reply to queries through the post.

Bulbs after flowering

(" Novice ").—It would be better

MARTINEAU & SMITH, Holloway Head, BIRMINGHAM

MISCELLANEOUS

Fruit, cut blooms, salad, and cost of production

(Chichester).—It may prove of valuable assistance if you read the various reports, especially relating to glasshouse crops, published by the Ministry of Agriculture, even though they do not include the "cost of production." Practically, there is no reliable data obtainable on this important matter, a matter that has been brought to the front only within the past five years. Widely discussed as it has been, nothing definite has happened, probably because no common line has been agreed upon on which a practical thesis can be constructed. The adverse opinion, unfavourably comparing the growing industry with War bonds as a safe investment, might equally apply to any other media, and though it might apply easily to past conditions we are on safe ground when we say that the industry is now on safer and more scientific lines, both in the growing and marketing of produce, and though the question of profit must depend upon skill, intelligence, and activity, there is a gratifying margin of profit for the right men. There is much technical detail to be considered, that the best advice we can give you is that you consult some expert (quite independent), and go over the ground involved. We can put you in touch with such an expert if you agree that such a course would be advisable.

Clay Coloured Weevil

(Clay).—The specimens you send for identification are Clay Coloured Weevil, Otiorrhychus picipes. This weevil is wingless and feeds at night upon a wide range of plants, attacking leaves, shoots, and bark. During the summer, eggs are deposited in the soil and the resulting grubs feed upon the roots of plants until the following spring. A brief period is spent as pupæ and then the new batch of adults appear. Spraying appears to be useless against this weevil and the best method of control is to trap and collect the adults. Pieces of old sacking placed near the attacked plants will make suitable traps. The grubs can be killed by applying crude naphthalene to the soil at the rate of 2 ozs. per square yard. This is best applied in winter and forked in 4 inches deep.

Millepedes

(E. S. Smith).—Yes, the specimens are Millepedes, Julus sp. If your garden is fully cropped you can do little now except to trap the millepedes by using pieces of potato buried 2 inches deep in the soil. During the winter you should use a good soil insecticide. Both naphthalene and calcium cyanide are good for the purpose of millepede control. Under garden conditions, dusting seed drills with superphosphate prior to sowing the seed has given good results especially with Peas and Beans.

Book and Pyrus wanted

(M. R. M., Bath).—(1) "Rock Gardens and Alpine Plants," by T. W. Sanders, with chapters on Water, Bog, and Moraine Garden, profusely illustrated, price 8s., or "Wall and Water Gardens," by Gertrude Jekyll, with 133 illustrations, price 15s. 9d. Either of the above would help you to solve your difficulty. (2) Pyrus floribunda. Messrs. Waterer, Sons, and Crisp, The Nurseries, Twyford, Berks.

Names of plants and reason for dying at leaf tips

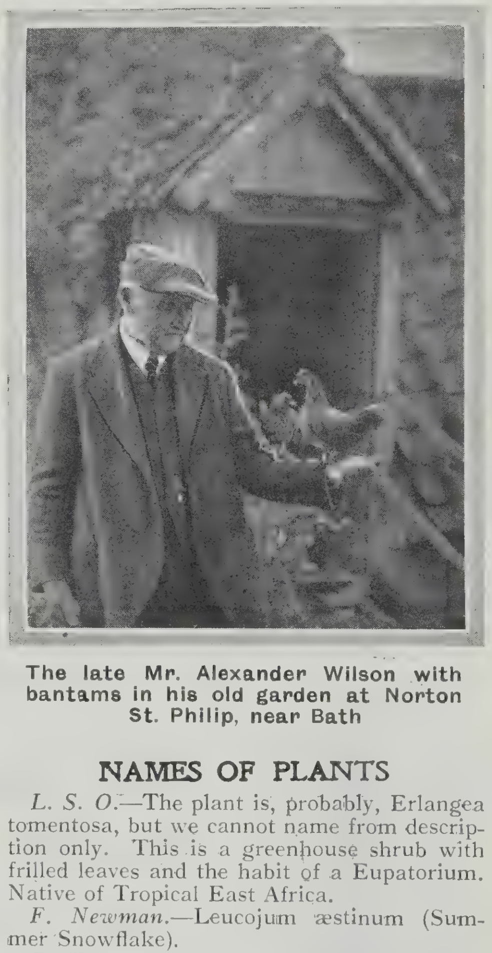
(G. S.).—It is almost impossible to name such things from a mere leaf. Flowers should be sent, and, if possible, some little description of the plant. No. 1 is, probably, Dietes Huttoni, and the damage to the leaves is caused by the cold of winter, when the tips are usually resting on the soil. No. 2 may be Dianella Tasmanica, and the damage to the leaf is due to the same cause as No. 1.

Manure from poultry runs

(H. B.).—Yes, fowl manure is of much the same value as pigeon manure, and should be treated and used in the same way. It is excellent for Sweet Peas, but must be used in great moderation.

Diseased Goldfish

(H. C.).—The fungus trouble on your Goldfish is a fairly common one, especially with fish in a confined pool such as yours. There is no cure once the attack has taken a hold. We think you would be well advised to destroy the fish and not to restock the pond for a time. When you start again do not put in so many fish. The water should be changed frequently, or rather a little fresh water should be poured in often and the water so displaced allowed to run away through the overflow.



The late Mr. Alexander Wilson with bantams in his old garden at Norton St. Philip, near Bath

NAMES OF PLANTS

L. S. O.—The plant is, probably, Erlangea tomentosa, but we cannot name from description only. This is a greenhouse shrub with frilled leaves and the habit of a Eupatorium. Native of Tropical East Africa.

F. Newman.—Leucojum æstinum (Summer Snowflake).

D. Y. H., Royston.—Acer Negundo.

J. O.—The Pearl Bush (Exochorda grandiflora). See note, page 397.)

A. M. A. H. R.—1, Spiræa confusa; 2, Berberis vulgaris.

Lostock.—The Bird Cherry (Prunus padus).

Carnholme.—1, Berberis dictophylla; 2, Corokea Cotoneaster; 3, Syringa villosa, a native of North China. This shrub requires very little pruning, just merely the removal of dead or weak wood and the old flower-trusses. The pruning or thinning should be done either in February or March.

W. H. Ward.—1, Deutzia longifolia; 2, Abelia grandiflora; 3, Exochorda Alberti.

C. S. Wills.—The Cuban Lily (Scilla peruviana).

Wotton-under-Edge.—Heuchera Richardsoni (satin leaf).

Mrs. D. M. Yonge.—Kniphofia Tuckii; Geum Borisii (single scarlet); Ge
reichii (deep orange). Will you, ple
ber flowers when sending again.

S. R. Cookson.—Akebia quinata

R. L. F.—1, White flower, Spir
bergii; 2, blue flower, Anchusa
flora.

G.—1, Syringa Emodi; 2, S. Ch
3, S. Mme. Lemoine; 4, Rosa ru
atropurpurea; 5, Spiræa cana;
ledifolia; 7, withered beyond recog
Rheum palmatum; 9, Rose
Yellow.

When the Leaves are Greenest

E have left the high noon of springtime, and summer stands like a gracious and welcome guest at our hreshold. It is the hour of dawn n of a June morning, with a ne in the eastern sky of a day of golden our. In the quiet of a little-frequented y lane, away from the beaten track, unds disturb, save a troop of chatter- jys, unseen overhead among the now unt leafage. A solitary thrush on the st bough of a tall Elm is singing the st of lyrics to nte in a neigh- ig coppice as she ly guards her brood. The murmur of falling over e in the brook is tive of rest and s. An old Willow as fallen across ream and im- sor a moment its ow. In a hole artly submerged a water-rail has o covert. The cattle is heard meadows be- as they stand the dew and . In this soli- spot there are when one may without meet- soul. A tor- road—an old path at its best, ed by pack- so tradition when centuries ad mines were l in the vicinity. it is impossible torists to nego- , as the notice at its entrance ter of a mile or more away indicates. ruts made at one time by farmers' re now grown over with grass. Paths her side of the lane are full of the rst of Mosses and tender grey-green of en, which intermingle with deeper leaves of Sloe and Bramble.

ist Recesses.

he coolest recesses near the margin of seam, white panicles rise from out soft leaves of Cow-Parsley and pale fronds ns. Whiter are the flowers of Stitch- emerging from tufted grass. In the dim twilight of the woodland hard by, where the path is greenest of all, the richest of pink Campions are broadening into beauty still. Birch and Beech and stately Oaks spread their long arms without let or hindrance, no woodcutter having plied his trade in this secluded place for many a day. As here and there the sun breaks in between the trees it reveals a sylvan scene, a perfect vista of loveliness in the freshest of young leafage—the magic of imminent summer. Now it is the bronzed fans of newly opened Sycamores, the winsomeness of a Silver Birch, or the grace of a Lime, but what impresses one most of all is the utter lavishness of green in varying tints in these enchanted leafy aisles. From out of the deeper confines of the woodland a cuckoo is calling, but less frequently than he did a month ago. Now there is a faltering in his notes—a break in the melody, a sure presage of his limited stay. A few weeks hence and his familiar voice will be heard no longer. He will obey that strange mysterious impulse—the migratory call, and journey southward to a far distant land.

When the leaves are greenest: Gunnera manicata, with large handsome foliage, by a woodland stream in Albury Park, Surrey

Old World Lane.

There is a sense of quiet and seclusion about this old world lane, making it a very sanctuary for birds and timid creatures of the field. In the brook, creamy plumes of Meadow Sweet are in their prime. Yellow Flag Irises thrive here. Flowers of the water Forget-me-not, screened from the sun under the shade of the trees, are in greatest abundance in brightest blue. Patches of Orchis in the rank herbage, where the stream has overflowed, stand out resplendent in their purple dress. Near what was once a clearing in this lane are remains of a tumble-down cottage, the roof of which has long since fallen in. Some of the decayed rafters lie strewn about the stone floor. On the hearth where the family once gathered, weeds abound, and Cuckoo Pints spread their shiny leaves; clusters of wild Thyme sprawling amid broken flags are full of buds almost ready to burst into bloom. Here the Deadly Nightshade thrives in crevices in what was once the kitchen. A robin has built her nest in a corner of the dismantled fireplace, and a wren has taken up her quarters close by the chimney breast. Bats cling between crevices of stones and bricks, only to sally forth under the curtain of night. A rabbit scampers out of a hole near the remains of an oaken door. Part of the lintel, black with age, is left, and over it in riotous freedom the slender draperies of Travellers' Joy entwine. All round this old derelict homestead are Nettles and Docks, a veritable wilderness of ruin and neglect.

> "Man trespassed here; but Nature lost
> No right of her domain;
> She waited, and she brought the old
> Wild beauty back again."

Through the flag-stones which once

The golden smile of June with bloom and sun in every place

The dell at Hillside, Kippington, Sevenoaks, where Rhododendrons, Azaleas, Meconopsis, Spiræas, and Primulas are now flowerin

formed the garden path, Gorse has sprung up into huge bushes, which flame at every point like burnished gold. Foxgloves are gay among tangled undergrowth, where a generation or two ago was a cultivated garden. Here, once, were borders full of old-time flowers tended by hands long since still. Here grew brilliant Pæonies, Columbines and Larkspurs, and in the autumn Golden Rod and stately Hollyhocks bloomed. Sweet smelling herbs of Lavender, Rosemary, and Balm were given a place. Here, too, colonies of Teazels have multiplied, their tall stems being full of green and purplish bracts, a rendezvous for innumerable linnets. Under an old gnarled tree there is still to be seen a portion of a rough seat, where the owner of this one-time paradise of flowers took his ease as he surveyed his favourites. A scent as of new mown hay tells where dying flowers of Woodruff lie amid their bed of fading green leaves. In this quiet spot, in shady nooks, snow-white flowers of Hawthorn linger late. Masses of Roses clambering on hedges in lavish beauty of delicate pink betray their presence by the sweet fragrance of their breath.

DELICIOUS INCENSE.

Sweeter still, from thousands of clusters, swaying in canopies from hedge and tree, the Woodbine diffuses its delicious incense in the air, proclaiming that summer days are nigh.

The fickleness of our climate, especially when adverse weather lingers on into spring, as was the case this year, has ever been a favourite theme for the satirist, but, after all, when in her rightful mood, what is there that can compare to our English countryside, or what can rival a flower-bespangled meadow under "the grace, the golden smile of June, with bloom and sun in every place"?

Never are the hedge-rows more attractive to the Nature-lover than in this royal month.

Never are the lanes more alluri
full of fresh young life.

Never are the fields more fair, u
as yet by the scythe of the mower.

Never are the woodlands seen in
trancing garb than in this their time
wealth of green-leaf beauty and of

San Diego in May

ALTHOUGH winter rains in Southern California this year were woefully light, the back country of San Diego County was in May a glorious wild flower garden.

Creamy spikes of Yucca Whipplei pierced the soft chaparral-covered hillsides. The Mimulus most in evidence was Diplacus puniceus. It is characteristic of this region and has rich brick-red (light or dark) flowers. Pentstemon antirrhinoides, often reaching a height of 5 feet, was gay with bright yellow blossoms, with red streaked, widely gaping corollas. Dicentra chrysantha, 5 feet and 6 feet tall, was just pushing into bloom. Dendromecon rigidum (Tree Poppy) bushes were one mass of buttercup-yellow. Pentstemon spectabilis covered the dry, gravelly hillsides and flat sandy places with a pink-lavender and blue glow, and in some parts rose to a height of 6 feet.

Nature was doing her best to cover the many burnt areas that are the result of last autumn's forest fires. These bla

Celmisia coriacea

EW ZEALAND has one of the most emarkable known floras; but in spite f this there are few who have any lea of its beauty and variety. It, how- stands alone in the universe for its rful variety of Veronicas and Cel- . Readers at home know quite well a Veronica is, because it is fairly easy cure as shipments of plants are re- tly sent from New Zealand. But not h Celmisias, as here you have a plant is not easily procurable. One can pro- eseed from various sources, but it is ary to understand that seed has to have l treatment to get results. Many New d seeds are of the same nature as the nsia, and to be successful it is neces- o set the same as a Gerbera, viz., put of seed only into soil. I would also the same as other Alpine seeds, viz., e box of planted seeds lie out in frost sow and then put box into a heated house, and this method should be suc- l. The Celmisia is very distinct from ry flowers and plants. The foliage very much in different varieties, and C. coriacea one sees the perfect plant, still greater, a wonderful pure white flower, and as one looks into its it is most difficult to believe it is an ry flower. The petals are of a dif- nature to an ordinary flower head, ne would think it was an exquisite ial material of lace. The flowers in the sation were 3 inches across. This plant s home in the Alpine regions of New nd, but some parts suit its conditions . In Arthurs Pass and Otira it is seen its beauty, and you will find it grow- every open spot in thousands, some- in open spaces exposed to sun and at other times at the foot of some waterfall, with spray splashing over whole time.

leaves are Iris-like, only beautiful grey; the lower side is covered with k silvery felt of hairs. As they grow however, the tomentum of the upper become woven into a thin skin that lies to the surface of the leaf, and under- t lies the two layered epidermis used for storage. The plant as illustrated was thousands in bloom during January at rs Pass,* where wild flowers blossom greatest profusion, forming a garden whose beauty might easily put to shame the stately flower ranks and geometrical foliage beds of many a prized garden.

Nelson, N.Z. A. WILKINSON.

Chelsea comments

It is not often one meets with a bit of more delicate and subtle irony than that on page 383. The comments so very true on the receptacles for Apples, the Death Valley, and the rock garden, were beautifully veiled; many have doubtless thought the same, but few could hide their disapproval so well.

E. BURRELL.

Saxifraga canis dalmatica

With all due deference to the bestower of the name upon this Saxifrage, which is understood to be a hybrid, it seems an unfortunate title to give to a good flower, while the trivial name of "Spotted Dog" is even less likely to commend this handsome Silver Saxifrage to students of catalogues. The plant is supposed to have possibly been derived from S. Aizoon and S. Cotyledon. It grows about 18 inches high at the most, and has handsome spires of bloom of a good white ground, but more heavily spotted with crimson than any other of its class. This is responsible for the name, but one more euphonious and pleasing might have been chosen for such a charming plant. This crimson spotting is so dense that it gives an impression of the blooms being zoned with crimson. It originated, I am led to understand, in the famous Six Hills Nursery of Messrs. Clarence Elliott, Ltd. S. canis dalmatica is as easily grown as any other plant of its section.

S. ARNOTT.

Celmisia coriacea in Arthur's Pass, New Zealand

Plants which require lime

Referring to an article in your paper on plants which require lime or chalk, it may interest readers to know that in my garden, where there is no lime or chalk, but red sandstone, Lilies of the Valley grow most luxuriantly; in fact, they overrun the ground like weeds, and are very large and bloom profusely. Clematis montana covers the roof of a building, and var. rubra grows over a large portion of the house, together with C. Flammula. Dogwood, too, is a weed; also Wayfaring tree. Lilies of the Valley also grow and bloom well in Jersey, and there is no lime in the island.

Two fine Japanese Cherries

Two of the best flowering Cherries are Shirofugen and Miyako. The former is also known as albo rosea and the latter as Okumiyako and longipes. Both are late flowering. The former has leaves often of a decidedly rounded appearance. The flowers, which are in corymbs, long stemmed and hanging down, are pink in the bud, pass to almost white, and back to pink before they fall. They have two leafy carpels in the centre. The latter is somewhat similar in habit. Its foliage is of a paler green and the flowers purer white when fully expanded. The habit and formation of the flowers are the same. Both are in flower now, June 3rd, and this is a very late season. Neither of these two varieties are very common, and the true plants seem difficult to get, and owing to the muddle in the names of the Japanese Cherries, it is difficult to get plants true to name. E. H. Wilson in his "Cherries of Japan" uses the names albo rosea and Miyako respectively. Mr. Collingwood Ingram uses Shirofugen and Oku-miyako. E. H. Wilson's book was published in 1916. So that, I suppose, Mr. Ingram now supersedes him as an authority on this subject.

CHERRY BLOSSOM.

Wisley, orange and rose

Many a time one walks about the gardens of one's friends amongst the trim Rose bed and orderly herbaceous borders, and there is no uplift of the heart and none of the joy that floods one's being at the sight of the beautiful. But yesterday at Wisley I walked in the woods among the rose-red Primulas and orange Poppies, and all around me the raindrops splashed and the Primulas' flounced skirts danced in return for so much kindliness, lovely drifts of rosy colour receding into shade, flooded here and there with glowing orange patches of the Welsh Poppy.

---

m "Plants of New Zealand," by Mr. B. M. Laing.

What happy gardener thought of that, I wonder? And betwixt them my adorable friends the big Lilies were unfolding their fat leaves and forming their heaven-born flowers, for here, in a week or two, is another wonderful joy awaiting all who care to see and whose eyes are open. And then I hied me to the rock garden and hugged to my heart the pure colour of Pentstemon roselli and Dianthus Sewell, and wondered how deeply my pocket would be affected to possess these treasures of light, and on to the pool hugged by the ragged blue of the Siberian Iris and where the gentle pitter-patter of the rain danced between the Lily leaves. Sonorous names and labels affected me not, catalogues and trials had no part; it was just the sheer beauty that God and man had made together. MAUDE HAWORTH-BOOTH.

Meconopsis Baileyi

FEW plants of recent introduction seem to have created so much well-merited interest as the above, and it may be helpful, therefore, to give an account of an amateur's first experience in its cultivation.

Seed was sown in leaf-mould and sand in July, 1927, and in June, 1928, small plants, to the number of 28, were put out in the borders. The soil of the latter is a sandy loam, to which has been added from time to time decayed leaves and a little stable manure; it is well drained, but fairly moist; the plants are in partial shade, but some get a considerable amount of sun. Of the above number, 21 have thrown up flower stems, mostly two to the plant, and these have attained an average height of over 3 feet, several are over 4 feet, and each stem has produced 12 flower buds. The accompanying photograph gives an idea of the appearance of one of the groups.

The plants are now, June 3rd, in full bloom, the top bloom being the first to open; the flowers are large—4 inches to 5 inches in diameter—and vary in colour from a Cambridge to a rather darker shade of blue. In all cases the colour is full, pure and striking, well set off by the golden anthers. In a few plants the flowers are light blue shot with a delicate mauve; both colours clean and bright and in no sense washy. Only one of the whole batch deserves the too severe strictures of "Clay" in your issue of January 12th and of "J. R. K." in that of January 26th last. In this case the colour is a dull and uninteresting mauve and the plant is small and miffy.

To the apparent ease of cultivation of this Poppy in suitable situations, its impressive size and glorious colour, must be added the fact that the flowers last long in beauty—5 to 7 days being their average life—do not fade with age, and are not easily damaged by wind. My information tends to show that it is truly perennial, and altogether we appear to have in Meconopsis Baileyi an acquisition to our gardens which is absolutely first-class in every respect.

In the letter alluded to above, "J. R. K." makes the astonishing assertion that it is "a wash-out in five plants or five gardens out of six." This suggests that "J. R. K.'s" experience of the plant has been either limited or unfortunate, neither case justifying such sweeping condemnation. I have seen it in three gardens besides my own, and my observation amply confirms the high opinion expressed of it in your issue of February 2nd last by such an authority as Mr. F. C. Puddle. A. E. FARRELL.

—— I read with interest your correspondent's account of "Blue Poppies at Gravetye."

In May of last year I bought two plants from a Scottish nurseryman. They did not flower, but, with only the protection of a few Ribes branches stuck round them, they came safely through the severe winter and are now in bloom. One plant has two stems, both flowering (June 5th).

Their disposition must be as serene and lovely as their azure faces, for our garden is in West Hartlepool, on the Durham coast, and they have had no special treatment. One plant is slightly shaded and has flowered first; the other, full in the sun, looks equally healthy and is now opening its top bud (June 7th).

The flowers, which apparently open one at a time, are 4 inches across and last each about a week. At first they close up at night and droop to the stem, later they remain widely open and are seen to best advantage facing a south walk or path.

Shelter is absolutely necessary. Six buds coming in a group at the top and opening first make the plant slightly top-heavy, and the softest band chafes the stem unless passed over a leaf. The three stems carry, respectively, 12, eight, and six buds.

Meconopsis Baileyi at Crowthorne, Berkshire

When better known this attractive and beautiful Poppy will be given a warm welcome by town gardeners. SARAH ROBSON.

Diseased Iris

I read the note on the treatment of soft rot in the Flag Irises with special interest, and shall certainly give the 2 per cent. solution of formalin as advised in your issue of June 8th. With regard to the cause of the disease, it is, I think, certain that the bacteria flourish in a damp soil and not to any great extent in a dry one. I have always adopted shallow planting for the Flag Irises, but this year as the rhizomes were showing above the soil and were subjected to frost, I threw some spadefuls of earth over them for protection. The clumps most deeply covered were the old Florentina and the Pallida Dalmatica, and these were the two which suffered. The disease did not make itself known until the flower buds could just be distinguished, and they did not, of course, reach maturity. They were planted near the top of a small rock garden with good drainage and the soil with ample lime in it, but they were growing close to small rocks supporting a higher ledge of earth. The spring season was an u
dry one, and, therefore, when the
became warmer I gave the Irises
which no doubt added to the troub
did not directly cause it. As preve
better than cure, I write this as a

Boronia megastigma

The chief characteristic of this pl
delicious scent, one small plant perf
greenhouse. It is what is termed
wooded plant, a native of Australi
growth is upright and slender, and
yellow-brown flowers are borne in g
fusion. The best compost is one of
a sixth part of sharp silver sand an
charcoal. The pots must be quite
well drained, and, like all fine-root
wooded plants, the Boronia requir
firmly potted. At all times water
carefully given, taking care to avo
tremes of wet and drought, which
After flowering, shorten the slender
to about two-thirds of their annual
and repot if required, but guard aga
potting.

ragrance of Clematis montana

MATIS MONTANA has many attri- es of the highest merit, but its de- lious fragrance is not often alluded to. ent of certain plants is such a fugitive ion that it is more than probable C. na may be practically odourless under conditions. However, a large mass lovely C. m. rubens, which has com- enveloped an old tree stump with its of blossoms, has this year been one most powerfully-scented shrubs in the . Their extraordinary fragrance has xtinguished that of some Azaleas close has, especially towards evening, filled room of the house, and is almost too nd sweet for any respectably middle- iver.

ve been trying to define this peculiarly ating odour, but it evades the net like butterfly. Does it recall the incensed ick of some Oriental temple, or those s of sacrifice which rise from the alters of Grasse? I asked an amiable ntleman whose nose I respect, and he ed, " Macaroons," and passed on. I a slip of a girl—" one of the new " who ought to know—and she said, yes! Boiling toffee!" I asked my " poor wretch "), and she, unwilling mit herself, said, " Those people who here yesterday said it smelt like ne Snee-awrum mixed up with a hairdressing establishment '." , I put the problem to one cunning dark secrets of flowers, but he only cated matters by saying, " New hot and steamy." So mystery still s the spicy aroma, cloying, sultry, and with which those rosy blossoms are ng the garden to the fall of the last led sepal. A. T. JOHNSON.

Cuphea platycentra

ong the many interesting plants used flower garden during the summer s may be included the above Cuphea, only known as the Cigar plant. Quite gificant in its individual flowers, it is retty and effective in the mass, and h plants put out at the beginning of June ly grow into a dense carpet, which may lieved by occasional taller plants of li rope, the lemon scented Eucalyptus, or ariegated form of Fuchsia gracilis.

Th fragrant Clematis montana rubens

Any of these combinations produce a quiet but pleasing effect. A few old plants re-potted on through the winter will produce an abundance of cuttings which strike readily.

E. BURRELL.

Herbaceous Calceolarias

PERHAPS because they are too little understood these greenhouse plants do not appeal to the average amateur. Most amateurs' glass consists of one heated house and a frame or two, in which they try to grow a variety of subjects and find that all plants do not succeed under the same treatment. Still, it is possible under these conditions to have good results by going the right way to work and studying the needs of these plants.

Amateurs should purchase the best seed possible from a firm that makes a speciality of the plant. Herbaceous Calceolarias may be propagated from either seeds or cuttings, but the seed is by far the better means, as the plants possess a more vigorous constitution than those raised from cuttings.

Some growers sow the seed the second or third week in July, but according to my experience I find the first or second week in June the most suitable time. Starting about a month earlier strong plants of a good size are secured by autumn, with fewer failures during winter. Take a perfectly clean seed-pan and place at the bottom an inch of small crocks, covering these with a layer of Moss or flaky leaf-mould, then fill up the pan with finely sifted soil composed of two parts loam, one part leaf-mould and silver sand, pressing it down firmly and making the surface quite level. Moisten the soil with a fine rose can, avoiding the necessity of applying water after the seed is sown.

The seed is extremely fine, therefore great care should be taken to sow thinly and evenly, and only the very slightest covering of fine silver sand put on. Place a sheet of glass over the pan and turn this each day to remove moisture, and place the whole in a cool house or pit and keep well shaded from sun. In about 10 days the seedlings will begin to appear, when at once remove the glass from the pan. When the second leaves show, the plants will be fit to handle, and no time must be lost in pricking off the young plants into pans, using a similar compost as before. There is great advantage in putting them into pans, as when taken from the seed-pan and placed in pots there is always the risk of the soil turning sour before the pots are filled with roots. Dibble them in about an inch apart each way, and as each pan is finished give a slight sprinkling of water to settle the soil about them, and place in the pit or frame, where they must be kept close until new roots are formed. In bright weather it will be necessary to give shade. When it is seen they are growing freely give a little air by tilting the light at the back, increasing this as the plants gain strength. Air is necessary from an early stage, as soon as the plants are strong enough. The plants must not be subjected to a check at any stage of their growth, therefore pot them off singly into 3-inch pots as soon as their leaves touch each other. Care must be taken lest they become dry at the roots, and they should have dewings or sprinklings of tepid water from a fine-rosed can. They must remain in the 3-inch pots until they have filled them with roots, when shift them on into 5-inch pots, using a leaf-mould, one part well-rotted cow manure, one part silver sand, and to every bushel of the compost add half a pint of soot, taking care to mix the whole thoroughly as soot is a powerful manure. No further shift will be necessary until February, when they must be placed in their flowering pots. These may be 6 inches or 8 inches in diameter, according to the size of the plant.

Clematis montana rubens on an old tree stump

By the end of September arrangements must be made to transfer the plants to the greenhouse near the glass, where fire-heat may be turned on in frosty weather, a temperature of 40 degs. to 50 degs. being quite sufficient. During winter watering must be very moderate, but when making their growth in autumn and spring liberal supplies of water will be required. As the sun gains power in March a little shade will be necessary on bright days, but it must be removed directly it is no longer required.

The only training required is to tie out the flower-stems as they rise, so as to obtain a level surface of bloom. When the pots are full of roots and the buds forming, the trusses will be much improved if the plants are given an occasional application of weak soot-water. If Green Fly attack the plants vaporise with nicotine. Remove all decaying foliage as soon as seen. Do not pack the plants close together, having regard to the tenderness of the leaves, and as the flowering season approaches give them plenty of head-room.

F. H.

Verbenas

Once used very extensively in the flower garden, Verbenas seem to have gone out of favour, though if not wanted for formal beds a few batches will be found useful in filling up spare ground on borders. Seedlings make nice bushy stuff by planting-out time if pricked out into boxes as soon as they can be handled, pinched early, and grown along quickly. One is thereby saved the trouble of keeping plants through the winter, which, with fluctuations of temperature, are often very subject to mildew. In bygone days, where special colours were required, I made a point of growing a number of seedlings annually and selecting required colours in order to secure a healthier stock. In this way I secured a white of strong, sturdy growth, with a large pure truss and very free. This was used freely for several years when a dwarf white flower was required. To get anything of equally robust constitution among the seedlings of blue shades was not an easy matter.

E. BURRELL.

Single-flowered Fuchsia Swanley Gem, tube and sepals glowing red, corolla pure white and cupped

Standard Fuchsias

THERE is something very attractive about a well-grown standard Fuchsia when in bloom, as it rises above other plants on a greenhouse stage or in a conservatory. To grow standards involves time and patience and a determination to sacrifice blooms for a season or so until the desired height has been reached, when the head can be encouraged to form. One may make a start in February or March by inserting cuttings singly in small pots of light loam, leaf-mould, and a good proportion of coarse sand, and plunging these in a propagator, or in a warm corner of the greenhouse to ensure rapid growth, potting the plants on as soon as it is seen they need a shift. Flower buds will not be long in forming, but these must be eliminated, the idea, of course, being to secure plants at a given height—anything from 2 feet to 4 feet—before any stopping is done. It will be an advantage if the stem is tied loosely to a thin stake to keep it straight. When the requisite height is reached the centre shoot should be pinched out, in order to encourage the formation of three or four shoots which will make a good head. Every encouragement should be given standards the first year or so by potting on and affording weak stimulants so that they can be built up into shapely plants. In selecting cuttings only the most vigorous should be chosen, and no side shoots should be allowed to appear to interfere in the growth, once rooting has taken place. It is a good plan when the shoots at the head commence to push out to arrange for cross pieces of wire or thin stakes to which the shoots can be tied and so support them. These need not protrude far and the foliage soon hides them.

During the winter months Fuchsias should not be subjected to much heat, in order that the plants can rest, though care must be taken that at no time are they allowed to get very dry. Amateurs who have not attempted the growing of standard Fuchsias will not find them difficult. Beyond Green Fly they have few enemies, and this pest can be got rid of by syringing and avoiding the plants getting dry. Fuchsias propagate easily from cuttings, and the veriest tyro in gardening can be successful with them if they are treated rationally.

The following sorts have long been acknowledged as being specially good for growing on for standards, and it is within the
scope of anyone with a greenhouse t
cure struck cuttings in spring with a v
start them on their way:—Singles: Sv

ves are about an inch long and $\frac{1}{8}$ in.
enerally oval, glossy green on the
urface, grey beneath, and bristly on
both sides, the flowers being borne singly or in pairs at the ends of the previous year's twigs.

It has lived out-of-doors for many years at Kew, and may be considered hardy in the Midlands and the south of England, although it would certainly be happiest near the south or west coast. It shares with the rest of the family their characteristic intolerance of lime, but if these two fads are kept in mind it is not a difficult plant to cultivate. When seen flourishing in a pocket of soil and covering the surface of a boulder, as it is in the rock garden at Wisley, it possesses a soft but irresistible charm worthy of any trouble that may be found necessary to make it at home.

F. R.

Ramondia serbica and R. Nathaliæ in flower together in vertical rock crevices in Mr. G. P. Baker's rock garden at Kippington, Sevenoaks

Arisarum probiscideum

This is an inconspicuous little plant belonging to the Araceæ and hailing from Southern Europe. Inconspicuous because the flowers are generally hidden by the big, shining, green leaves, which are very sagittate in shape, quite like those of the common Cuckoo-pint or Lords-and-Ladies in fact, and 3 inches or 4 inches long. Even when the flowers are hunted out, however, from under their canopy of foliage they prove to be anything but beautiful, their chief claim to cultivation lying in their grotesque form, and they are odd enough to recommend themselves to any lover of the unusual in flowers. The tip of the spathe is drawn out into a thin flexible tube several inches in length and resembling nothing so much as a mouse's tail.

There is another plant, strangely enough, whose flowers, though botanically remote from the Mousetail, yet produce a somewhat similar effect—Phyteuma comosum. This belongs to the Campanula family, but is very different from other members of it in outward appearance, for the flowers are borne in large heads or umbels, and in each one the corolla bulges out at the base and is then drawn in again at the top, looking like an inflated paper bag ready to be burst. The likeness of the bag to the cowl of the Mousetail, however, is heightened by the protrusion of the style at the neck, forming a distinct tail. Arisarum likes a deep, rich, moist soil, and is at home in partial shade in a rock garden, while it also makes an excellent carpet of rich, glossy, green in the bog garden. It spreads rapidly, making little white, lumpy, oblong tubers, which afford a ready means of propagation.

F. C. S. Robinson.

Dianthus Freynii and D. microlepis

Though Dianthus Freynii and its near ally, D. microlepis, do not appeal to those who seek for bold and showy effects in their rock gardens, to those who admire the more miniature yet perfect beauty of the dwarfer flowers, both give true delight.

It is impossible to overpraise these two miniature Pinks, which are seen at their best in a moraine, with their exquisite little cushions of blue-green or more vivid emerald spangled over with the miniature yet perfect rose or white flowers. There is little difference between the two, and, for that matter, from a garden standpoint they might be classed together. D. Freynii is more of a blue-green than D. microlepis, but the latter's foliage hues vary considerably. All of them, however, present the same close cushion of tiny leaves, with the charming flowers sitting almost on the surface of the cushion. These Dianthuses may be grown in the rock garden in very free and gritty soil and in sun, but they appear happier in the moraine, where they form lovely cushions or mats only a few inches across, and where they increase by self-sown seeds. Propagation may be effected by seeds or cuttings.

So far as I have observed, these Dianthuses appear to have no preference as regards lime in the soil. S. Arnott.

Patrinea palmata

This lovely plant is charming for the rock garden, where it usually thrives in soils of an open nature. In general appearance the flower is that of our native Centaury, with its abundance of flowers; but instead of pink clusters of flowers, it bears showy, yellow blossoms, gracefully set off in its handsome, glossy leaves. It bears a loose head of flowers about 9 inches high, which last a considerable time, and will withstand full exposure to the sun if given plenty of water at the roots. Not the least attractive feature about the plant is its mild fragrance. It is particularly useful in consequence of coming into bloom during July, when other bright colours are fading away.

It should be grown in broad masses in positions where a rich, summer effect is desired. I grow it in loam and leaf-mould, mixed with small stones, and in a position where it can have plenty of water and sunshine. It may be grown on fully exposed spots, but in too dry a position it is apt to become stunted with the droughts of early summer; when placed in some moist cranny, however, it soon expands into tufts of the loveliest rich yellow and continues in flower for a long time.

It is of such remarkable beauty and grace that it may be used with good effect on the lower flanks of the rock garden where the rock is suggested rather than exposed. Plants may be purchased in pots at any season.

H. Stevens.

Hippocrepis comosa

This is one of the prettiest of our native plants and well worthy of cultivation on walls or some arid position on the rock garden where a plant of trailing habit is required. It is a neat plant with a prostrate habit, forming a dense mass of wiry shoots that freely trail along the ground, bearing a profusion of bright yellow blossoms in Coronilla-like heads on slender stems well above the foliage. The unopened flowers are drooping in the bud, which adds greatly to their charm.

The plant is quite perennial, but on some cold soils perishes in winter. Where it does so it should be raised annually from cuttings. It will thrive in any soil, and may be used with the best effect as a drooping plant over the face of a large rock. H. Stevens.

The plague of weeds

In all the language of gardening there is no truer saying than the old adage, "One year's seeding, seven years' weeding." Personally, I have good cause to realise the truth of this saying. I had the misfortune three years ago to take possession of a garden which, owing to its having been for some time tenantless, became literally overrun with weeds. This will be my third year of weeding, and I look forward, if I am spared, to the full quota of years allocated by the originator of the famous saying. Each spring a fresh batch of dormant seed is brought to the surface of the soil to await its development in seasonable course. And herein, of course, lies the truth of the adage. It is quite impossible in a year or two, even with the most rigorous weeding, to exterminate the produce of one year's seeding. Many seeds fail to germinate the first year or so because in the ordinary course of cultivation they get buried in the soil. It is quite true that a proportion of the seeds which are buried in the soil rot and become harmless, but it is equally true that many retai
germination powers for some years and
brought to the surface, soon sta
growth. This is why the results of ne
cultivation are not always apparent
and why the sins of a former tenant
visited on his unfortunate successor.

The curse of weeds may, of cour
many other gardening adversities,
garded as one of the preventable trou
the gardener, but, unfortunately, this
of the cases where the innocent mus
for the guilty. The tidy and indu
cultivator has too often to cope with
of weeds which have sprung from see
duced by a careless and negligent nei
The harm done by careless gardeners

boxes for summer flowers

v bright flowers in tubs or boxes are ceptable through the summer months urban gardens where there is little or beds or borders. Oak tubs with are the best, but they are expensive ond the reach of limited incomes, and erefore, welcomes the New Zealand gentine butter-boxes, which are re-or a few pence. Made of stout Pine inch in thickness and 12 inches each nside measurement), they will, with st three seasons. If the bottom is in ece a few holes should be bored for drainage and a couple of slips screwed on two sides to keep it clear of the ground. Also the boxes should have an exterior coat of paint of a nice green shade or of Oak varnish. Pelargoniums like Paul Crampel, King of Denmark, and La Cygne; Fuchsias General Roberts and Ballet Girl; Salvia Pride of Zurich and Heliotrope The Speaker are a few of the older things that can be relied on to flower freely and continuously until the advent of frost. Two or three boxes of Frankoa ramosa are also welcome. The long, feathery spikes are a pleasing break from the dwarfer things. There are, of course, many hardy flowers that can be used for a similar purpose, as Funkias, Œnotheras, early Phloxes, and Starworts of the Amellus and Cordifolius type, but their flowering season is not so long sustained as that of the tender plant above noted.

In preparing soil for and filling boxes avoid too much drainage, and place over the crocks a layer of dry cow manure. This is better than leaves or Moss, as it acts as a good stimulant to the plants when the roots penetrate to that depth; also some of the same thoroughly broken up and rendered fine can be mixed with the soil, three parts loam and one of leaf-soil. I used to find no better compost than that from a heap of good road-sidings, but it is risky in these days with a lot of tar on the roads, also there is a lack of anything in the way of manure incorporated with the road-siding. Petrol is strongly in evidence, but very few horse-droppings. It may be well to add a special note in connection with this box gardening, that it is not advisable to make a start with it if the householder contemplates an absence from home for some two or three weeks through the summer months and has no one on whom he can rely to attend to the plants during his absence. I fear he would find them sorry objects on his return if the weather had proved hot and dry. E. BURRELL.

Lavatera (Mallow)

Although the Mallows, generally speaking, do not rank very high amongst the more important border plants, they include several which are very showy, free-flowering subjects, especially when planted in positions where comparatively tall plants are in request. They are, moreover, particularly useful for indoor decoration. Some of the more modern varieties are very good, the flowers being rich in colour, and deserving of extended cultivation. One of the foremost varieties among the hardy annual Lavateras is rosea splendens; this variety possesses excellent qualities as a garden plant, besides being very useful for cutting, the blooms lasting in good condition for a considerable time. Growing about 3 feet high, with large, brilliant rosy-pink flowers, it is very effective. Another form of splendens, called Sunset, has deep rose-pink flowers and grows about 2½ feet high. Loveliness, a form of rosea splendens, bears flowers of a much richer colour, with foliage of a bronzy hue. As a contrast to the foregoing, the variety known as alba splendens has large, glossy, white flowers; this variety grows about 3 feet high. L. trimestris, a South European annual, of similar height to the preceding, bears large, pale rose coloured flowers, and very useful as a border subject. There is also a white form of the above. The annual Mallows transplant rather badly, therefore seed is best sown where they are intended to flower. They thrive in rich and somewhat light soil, which should be well prepared before sowing the seed. Plenty of space should be given the plants for development, the height being indicative of the distance to allow.

One of the best among the perennial species is L. Olbia. This forms a neat, pyramidal bush 4 feet to 5 feet high, with sprays of clear, rose-pink flowers freely produced. It makes a bold and effective subject for the flower border or in the shrubbery. Small plants grown in pots are employed very largely for indoor decoration, for which purpose it is extremely useful. The Tree Mallow, L. arborea, attains a height of nearly 10 feet in the more favoured counties. There is also a variegated form of the latter, L. a. variegata, with red flowers and yellow, mottled leaves. J. L.

Herbaceous Calceolarias

The seeds of these handsome plants should now be sown in pans of sandy and leafy soil all passed through a fine meshed sieve. Water the pans a few hours before sowing the very fine seed, which should be sprinkled thinly over the surface and dusted over lightly with fine soil or sand. Stand the receptacles on a cool bed of ashes, cover with a sheet of glass, and shade from sunshine; cool, moist conditions being necessary for their welfare.

THE IRIS SHOW

THE Iris Society—a young and very active body—is to be heartily congratulated upon the success of the show held in the Royal Horticultural Society's New Hall on June 6th and 7th.

It was unquestionably the finest show of Irises ever held in this country, and the arrangements for the exhibition left nothing to be desired. The Society is fortunate in having an enthusiastic Hon. Secretary in Mr. G. L. Pilkington, assisted by many willing helpers. A special vote of thanks is due to Mr. George Dillistone for the planning and organisation of this exhibition, and to Major George Churcher, the Hon. Treasurer.

The show was opened by the French Ambassador, introduced by Sir William Lawrence, the President of the Iris Society. In the afternoon lady members of the Garden Clubs of America were entertained to tea, when Mr. Gerald Loder, President of the Royal Horticultural Society, made a speech of welcome to the visitors that gladdened the hearts of all present.

The centre of the hall was filled with large groups of Irises by nurserymen.

Here were to be seen the exhibits of the well-known Iris growers, Wallace and Co., G. Bunyard and Co., The Orpington Nurseries, W. Wells, Junr., Waterer, Sons, and Crisp, Barr and Sons, George Whitelegg, Amos Perry, Mrs. W. R. Dykes, Daniels Bros., Lowe and Gibson, and Gavin Jones.

Competitive exhibits from amateurs, together with collections of Iris paintings, were arranged round the sides of the hall.

Competition was good in the amateur classes, and there were about 180 entries. In passing, it may be interesting to record that the attendance at the show was as follows:—First day, 2,681; second day, 2,282; total, 4,963.

Looking back upon the show, varieties of special merit that stand out clearly in this vast array of Irises were Mme. Cecile Bouscault (mauve-pink), shown by G. L. Pinkington, Mrs. Valerie West, Lent A. Williamson, Shekinah, Misa, Bruno, Zoano, Duke of Bedford, John Waterer, Grace Sturtevant, Tenebrae, Seminole, Goldcrest, Moonlight, Ed. Michel, Aphrodite, Lord of June, Marjory Tinley, Ann Page, Amber, Corrida, Magnifica, Louis Bel (the darkest purple in the hall—almost black), Dominion, Souv. de Mme. Gaudichau.

In the opinion of Mr. George Yeld, that fine old variety, Crusader, raised by Sir Michael Foster, is still in the front rank among bearded Irises.

The leading amateur exhibitors and prize winners were:—G. L. Pilkington, B. R. Long, Mr. C. W. Christie Miller, E. W. Meyerstein, Rev. Rollo Meyer, G. P. Baker, Sir William Lawrence, Sutcliffe Pyman, Lady Elphinstone, George Yeld, Mrs. S. M. Garnett, Mrs. Fitz-Hugh, Miss Pesel, F. Wynn Hellings, F. W. Tomalin, E. C. Levett, and G. H. Furness.

In addition to many other prizes, Mr. G. L. Pilkington won the Silver Medal of the American Iris Society and the Challenge Cup presented by Mrs. Philip Runciman for the best exhibit by an amateur. This exhibit was one of the features of the show. The Gordon-Lennox Challenge Cup was won by London Gardens, Ltd., for a decorative exhibit.

Collections of Iris paintings were of exceptional interest, and included the work of W. J. Caparne, Frank Galsworthy, and Champion Jones, the paintings by the last named being kindly lent by Miss Willmott.

NEW SEEDLINGS

The classes for new seedlings were keenly contested, and the following awards made: Silver gilt medal, Carfax (red-purple), of tall branching habit, shown by Mr. A. J. Bliss, Tavistock.

Silver medal: Trigo (tall, dark purple), shown by Miss Insole and recommended for the Dykes Memorial Medal.

Mrs. George Whitelegg, a neat, medium-sized flower, standards amber, with dark brown reticulations on falls, shown by George Whitelegg.

A silver medal for new seedlings was also awarded to Mr. Amos Perry for Joan Curtis, an improved Flaming Sword. The Certificate of Merit for new seedlings was awarded to G. L. Pilkington for Yukon, a very light blue, and for unnamed seedlings shown by Miss Insole, Frank Burton, Mrs. Hamilton Rowan, and Amos Perry. H. C.

The Luncheon

Sir William Lawrence presided at the Iris Society's luncheon, and among the guests were Continental growers of the Iris and members of the Garden Club of America.

The toast of "The Iris Society" was proposed by Mr. Raymond E. Cox, of the United States Embassy.

The President, proposing the toast of "The Guests," pleaded for free trade between the nations in flowers and plants. Restrictions on the importation, he said, were imposed by Ministers of Agriculture ostensibly as safeguards against the introduction of diseases affecting flowers and plants. That was all right, but he often had his doubts as to the motive. Ladies of the Garden Club of America who visited his gardens at Burford, Dorking, had asked him where they could get some of the plants which they admired, and he told them that they were to be had from growers in this country or on the Continent. He was then informed that plants imported into America had to be baked on their arrival before delivery so as to destroy insects. Plants were, therefore, chiefly obtained from Japan, because the journey across the Pacific was shorter and because such plants did not have to be baked. He was not going to put any blame on America, but he felt that such regulations, having been started with the most laudable of motives, tended to degenerate into protection.

Mrs. Lloyd, of the American Iris Society, spoke highly of the English raised varieties Dominion and Lord of June, and said that as Mr. Hoover had promised that the Department of Agriculture was to be reorganised, they had hopes in America that all the beautiful flowers they had seen at the show would be allowed to come in.

Mdlle. Yvonne Salmon, University of Reading, and Mr. Hoog, Holland, also replied.

Iris Show; Riviera jottings

By ED. H. WOODALL.

WHAT a wonderful show of Irises was to be seen in the New Hall! The masses of bloom and the number of named varieties were such that every Iris enthusiast needed to be there if only to determine for himself or herself which flower should be his or her choice. It must be said that there are *too many names,* and only personal observation can decide what choice one will make out of so many. But when all are beautiful how difficult it is to choose! Having recently returned from the South of France, where these June-flowering Irises enjoy the most robust
health, I can at least compare the be
-of some varieties, and it is very sati
to say that many very beautiful form
good, if not better, in England than
south.

For instance, I can freely assert th
flowers as the richly coloured Alca
striking Aphrodite, the beautifu
Ballerine, the ruddy Evadne, the

SEEN AT THE IRIS SHOW

REMINDERS FOR THE WEEK

Southern and Midland

Tomatoes

Assist the swelling fruits with a weekly application of manure water, care being taken to see that the plants are not unduly dry when applying the latter, otherwise scorching of the foliage will result. All ripe fruits should be removed as there is a tendency for such to split when permitted to remain upon the plants in a hot, moist atmosphere. An occasional spraying of the plants will then do no harm; indeed, it will assist in maintaining the plants in a clean and vigorous condition. Remove all side shoots at regular intervals, as these congest the plants, shut out air, and tend to encourage attacks of White Fly. Should the latter put in an appearance, cyaniding must be resorted to immediately, and repeated every ten days, until this pest is stamped out.

Onions

Those sown in March should be thinned out to a few inches apart, according to requirements, many preferring medium-sized bulbs to those of a large size. If, however, the latter are required, then a foot between the plants is advised. Immediately thinning has taken place, the hoe should be run through the soil and the latter pressed firmly around the base of the plants as a guard against Onion Fly, which has become a menace in many gardens. Should the latter make its appearance, mix a wine-glass full of paraffin with a pint of boiling water, adding the latter to 3 gallons of soft water, and rose this along each drill, applying it during the evening.

Winter vegetables

All varieties of Broccoli, Brussels Sprouts, Borekoles, Cabbage, Leeks, Savoys, Coleworts, etc., must now be planted out in quantity, and although the most satisfactory results are obtained when clear ground is available, it frequently happens that, in gardens of limited dimensions, one is compelled to plant between rows of early Potatoes; in such instances allowance should be made by leaving a little more space between the plants. Should the weather at the time prove hot and dry, water must be frequently applied until the plants are established.

Asparagus

Cutting should cease after this date in order to give the plants a chance to build up good crowns for next year's supply. Apply a dressing of agricultural salt to the beds, and when growth is advanced feed the beds liberally; the drainage from farmyards, when diluted, being excellent for this purpose. Keep the surface stirred with the hoe.

Late vineries

Admit air freely and feed liberally if the crop is a good one, as a great deal of moisture will be absorbed by the rapid growth and swelling fruit. It is often possible to dispense with fire heat altogether from this date, except during temporary spells of dull, rainy weather, when a gentle circulation of warmth through the pipes during the night is advisable. Such houses usually contain a variety of kinds, and immediately the earliest of these commence to colour, little air should be left on the top of the house during the night, so long as the temperature is not permitted to fall unduly.

Strawberries

No time must be lost in getting the plants mulched with clean straw if the fruits are to be gathered clean, but straw is almost unobtainable in some districts and resort must be made to bracken, or even grass cut before going to seed. I have seen the latter used with satisfactory results.

Autumn fruiting Raspberries

These always produce a quantity of surplus growths at their base, and before such are permitted to sap the vitality of the plants they should be removed, it being possible to judge which are the best to retain when the shoots are a foot in height, and those remaining must be encouraged by frequent applications of water. Those carrying crops of swelling fruits should receive a weekly dose of liquid manure

Fruit trees

A good wash for the destruction of the numerous caterpillars now devouring the leaves of fruit trees is "Katakilla," which kills whenever it comes in contact, and is very safe to use. Some sprays, while perfectly safe to use on certain varieties of Apples, are dangerous on others, causing the trees to shed their leaves, and thus care is needed in selecting a wash. Whatever is used, it is essential to drive it with force into all parts of the trees.

Roses

Even where carpets of dwarf plants are used to beds of Roses, the latter are improved by a frequent stirring of the surface soil; Green Fly and Caterpillar are present and must be destroyed by spraying. Quassia and nicotine is a very effective remedy and is offered already mixed, as here given, by various horticultural sundriesmen.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Maincrop Leeks

If the plants have attained a decent size they should now be planted on very rich and deeply-worked soil in an open position. Drills 3 inches deep and 15 inches to 18 inches apart should be drawn with a hoe, and the Leeks planted in the bottoms of these, allowing from 6 inches to 9 inches from plant to plant in the rows. By planting in drills, the length of blanch is extended, the soil being worked in with the Dutch hoe as growth advances.

Russian Kale

This is probably the best of all the Kales as regards pleasant flavour, so it is rather curious that it is so much neglected in gardens. It is quite as hardy as any of the Borecoles, and is in use from November till April. In appearance it somewhat resembles the old Ragged Jack, but is in every way superior. The treatment usually afforded the ordinary Kales suits it admirably.

Winningstadt Cabbage

For use in autumn and early winter no other Cabbage can compare with this variety. It is very hardy and much superior in table quality to the early Savoys. Planted on rich but firm soil, it attains a fair size, while in flavour it is always pleasant and agreeable. Allow about 21 inches between the plants each way.

Kidney Beans

Another sowing should now be got in, this being probably the most important batch of the lot. It is always desirable to sow more than one variety at this time, and I can recommend Sutton's Masterpiece, Sutton's Evergreen, and, of course, a good strain of the old Canadian Wonder, which for general excellence is still unsurpassed. Rich, well-tilled soil and an open, sunny posi
necessary for best results.

Savoys

If the above Cabbage be grown, t
very little use for the early varieties;
use after Christmas such varieties as
son's Omega and Ormskirk are most
being very hardy and of good quality.
these 2 feet from plant to plant, eac
and plant on fairly rich ground.

Cucumbers

During the height of summer, Thr
Red Spider are apt to be very troub
unless the plants are vigorously sy
daily and the beds and paths fre
damped down. A dry, hot atmosphe
dryness at the roots are specially
guarded against, as these are the con
in which these pests thrive and m
Well thin out the shoots and afford
shade over the glass.

Salading plants

Frequent small sowings of Lettu
Radish are necessary in preference t
quantities being put in at long int
while Mustard and Cress should be
every four or five days, according to d

Tomatoes

Generous supplies of water are
necessary, especially for plants grow
pots or in boxes, but, at the same tin
soil must not be kept constantly sat
As the plants are now carrying
quantities of fruit, feeding must
neglected, although care should be ex
as too strong doses may easily do
harm.

Grape thinning

If possible have this very necessa
rather tedious, job undertaken during
wet days, for when the sun is shining
glass it is impossible to perform it i
thing like comfort.

Outdoor Peaches

Dryness at the roots is the worst
the Peach has to contend with. Being
always planted against a south wall
seldom possible in summer and
autumn to do without hand waterin
however, a generous layer of old mar
spread all over the surface as far
roots are likely to extend, much less w
will be necessary, the mulch helping w
fully to conserve moisture, besides k
the roots nice and cool.

Strawberry beds

If not yet done, get the rows "
down" with clean straw, or long,
grass, to prevent the fruits being sp
with mud. Before doing so, howev
move all weeds and "runners," an
hoe the surface. In the case of nev
laid down in spring, continue to r
flower-stems as they appear, and
"runners," unless the latter are requ
furnish plants in autumn. If the w
continues dry, a thorough soaking of
will greatly help the swelling berries

Thin hardy annuals

Continue to thin out these plants a
become fit to handle. It is best, whe
sible, to go over the beds twice at an i
of two or three weeks. At the first th
leave the little plants about 2 inches
and, at the final look-over, increase the
between each considerably, for it is o
giving these useful subjects abundant
that they give of their best.

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FLOWER GARDEN

s

A.).—Pæonies of all kinds greatly
disturbance at the roots, so if you
oved your plants recently, that fully
s for their failing to bloom. If this
the cause, we would require some
information concerning the treat-
e plants received before we could give
inite opinion on the matter.

the Valley

. P.).—Frankly, we are puzzled to
for the conduct of your Lily of the
for we have seldom seen healthier and stronger foliage, and there is certainly nothing wrong with the roots. Have you been spraying fruit trees or bushes near to the Lily bed? The flowers look as if they had had some strong chemical sprayed over them, or else fumes from some chemical work, should such a thing be near, would account for the trouble. Sorry we cannot elucidate the matter further.

Diseased Irises

(W. J. O.).—No, your Irises are not affected with Botrytis disease, but with an Iris Leaf Spot caused by Heterosporium gracile. This disease affects several kinds of plants, *e.g.*, Iris, Hemerocallis, Freesia, etc. Your best plan will be to go over the affected foliage and cut away and burn the affected portions. Spray the healthy portions with a solution of sulphide of potassium at the rate of 1 oz. to 3 gallons of water. Repeat this treatment as often as is necessary to obtain control. Just as growth commences next year give the plants a thorough soaking with Cheshunt compound.

Tulip Fire

(Doubtful).—Your Tulips are infected with the disease called Tulip Fire. This disease carries itself over from one season to another by means of small black bodies which form towards the end of the season in the scales surrounding the bulb. You should collect and burn all the affected foliage, and when growth is complete in the rest of the bulbs, the whole should be lifted. Sort the bulbs over carefully before replanting and destroy those showing signs of the disease. The bulbs should be planted in another site next year.

Tulip dying off

(F. Sherwood Taylor).—The jar containing soil and Tulip bulbs has been examined and the creatures present are millepedes, Julus sp., but we are very doubtful as to whether or no they are the sole cause of the trouble. From the appearance of the bulbs we think that some other soil insect has been at work, probably wireworm. In either case your best plan will be to lift all the bulbs so soon as they have completed their growth, examine the bulbs carefully and burn any that show extensive signs of decay. Before planting back, the soil should receive a dressing of a good soil insecticide applied according to the makers' directions. Throughout the summer you could reduce the numbers of millepedes and wireworm by placing Potato traps in your soil. Take a Potato and cut into two, obtain some pointed sticks about 3 inches long and insert the point into the Potato, then bury the trap, leaving about 2 inches of stick out of the ground. Examine the trap once a week and destroy the collected pests.

Iris and Agapanthus foliage

(N. Jackson).—Your Irises are affected with a Leaf Spot caused by Heterosporium gracile. Please see reply to "W. J. O." as to control measures. We have carefully examined the Agapanthus foliage and can find nothing that would account for the trouble. It is possible that the spots are caused by the sun scalding through spots of water collected on the foliage. If so, moving the position of the tubs may put the matter right. Please note that we do not reply to queries through the post.

Diseased Antirrhinums

(J. E. S.).—Your Antirrhinums are affected with a Leaf Spot caused by a species of Cerospora. As only a few plants are affected it would appear that your best plan would be to spray the diseased plants with a weak solution of liver of sulphur, potassium sulphide, using 1 oz. of the chemical in 4 gallons of water. Dissolve the material in a little hot water and make up to 4 gallons with cold, soft water. Repeat the spray at intervals of a few days if necessary. When spraying, pay more attention to the plants that are near those affected; the spray fluid should prevent the spread of the trouble.

Diseased Lupin

(H. V.).—We have incubated the material sent and can find no trace of a fungus present which would account for the plants failing. It is probable that the real cause of the trouble is either "foot rot" or eelworm, either of which would be situated in the root stock, and, therefore, absent in the portion of plant sent. The severe winter has no doubt weakened many herbaceous plants, and we receive complaints by almost each post to this effect. You can do nothing except take up affected plants and burn them. Woodlice will, of course, aggravate the trouble; this pest could be trapped by loosely filling flower pots with hay that has been steeped in boiling water. The flower pots should be inverted and placed where the woodlice are most plentiful; examine each morning and kill the woodlice collected.

Delphiniums dying

(A. E. H.).—We have examined your specimens and can find no trace of an organism which could cause the death of the plant. It appears to us likely that some of the plants were killed by the severe winter, and that those that grew a little and then went off were so weakened by the weather that they failed to survive. Did you give any sort of protection over the crowns of the plants during winter? A little dry ash from a garden fire would be a good material to use for this purpose. The vaporite has had nothing to do with the trouble.

Lupin dropping flowers

(R. Sutton).—It is impossible to say the cause of the Lupins dropping their flowers without a complete plant for examination. It is quite possible that the cold weather has had something to do with it, but on the other hand we rather suspect root trouble. Take up a plant and see if the root system is in good condition. If not, send it along and we can examine it for you and report in due course.

Increasing Lupins by means of cuttings

(W. B. Clark).—You do not say to which species you refer, so we deal with both. Cuttings of Tree Lupins torn off with a heel attached and inserted in sandy soil in a cool frame about the second week in August will root freely. The cuttings should not exceed 4 inches in length, they must be shaded for a time from bright sunshine, and sprayed lightly over in the evening following hot, sunny days, but on no account kept in a constantly wet condition. Herbaceous Lupins: side shoots may be torn off these, both in spring and after flowering, and if treated as recommended for Tree Lupins will root readily. We have also rooted these plants in sandy soil at the rear of a north wall in the open in late summer, when shoots 6 inches in length may be used.

Time to sow the seed of Meconopsis Baileyi and other species

(W. B. Clark).—From the end of July to the beginning of September is the best time to sow the seed of Meconopsis Baileyi and all the other species which bloom at the same time. Later flowering kinds, such as Wallacei, should be sown immediately the seeds are ripe, preferably before the second week in September. If sown in pots or pans of fine sandy and leafy soil and kept in a cool closed frame, germination will soon take place. Shade from bright sunshine is necessary, and a slate or tile placed over the pots will prevent evaporation. Expose the young seedlings to light and sunshine very gradually.

GREENHOUSE

Dracæna indivisa damaged by frost

(C. E. Hoyland).—It depends on what sort of a plant you desire. If you require one with a single stem, reduce the young shoots to three when about 2 inches long, and in about a fortnight's time retain the most promising of the three and remove the remainder. But if you prefer two or three stems from the base, leave the three, as very handsome specimens are often seen with several stems, but if elegance is desirable retain one only. You did quite right in cutting the old stem down and dressing the wound.

Seedling Nerines

(E. B.).—None of the Nerines are really hardy in this country. The seedlings should remain in the seed pan in which they were raised for a couple of years and be then potted off singly into 3-inch pots, in which they should be kept until they flower. The time taken to reach the flowering state varies considerably, but is seldom under four years, and until they are large enough to bloom it is desirable to keep them growing slowly, so water must be given all the year. The soil that suits this plant well is a mixture of 2 parts best fibrous loam, 1 part leaf-mould, and enough clean, sharp sand to ensure porosity.

Strelitzia Regina

(W. R. J.).—The Bird of Paradise Flower (for such it is often called) is a cool greenhouse plant, and we doubt whether you will be able to do much with it in a living-room window. We advise you to keep it on the
dry side whilst in a small state, an
into a larger pot when it is seen th
roots are travelling well round the
one. A compost consisting of 3 part
and 1 part made up of leaf-mould, pe
sand will suit it admirably. Water wi
and give all the sunshine possible.

TREES AND SHRUBS

Douglas Fir

(A. W.).—While the Douglas Fir, af
coming properly established, is pe
hardy, in the young state, and esp
when recently planted, it is apt to be h
hard frost, and even if it escaped th
very dry spring must have been very
to these young trees. We would be i
to defer the planting of this tree
February.

Japanese Maples

(M. L. W.).—(1) You would probab
that budding rather than grafting wou
suit your purpose. Do this in Augu
is hardly possible to give every detail
process in the space at disposal, but
know how Roses are budded you will h
trouble in carrying this out. (2) Th
can be propagated by seeds sown imme
they are ripe, by cuttings in autumn,
layering during late summer. (3) Th
mon Maple is used as a stock, and "
grafting in spring is the usual meth
ployed.

Wistaria not flowering

(Mrs. A.).—Without knowing your
of culture of the Wistaria we have di
in helping you to determine the reas
the non-blooming of your plants. If a
to grow unchecked this plant does not
produce many flowers, especially whe
young, vigorous state. The side
should be shortened back during sum
much the same manner employed fo
fruit trees, while in winter these same
are cut further back, and thus encoura
production of flower-buds.

Diseased Scotch Fir

(I. S. Turnbull).—The specimen of
Fir sent in for examination is affecte
Pine Cluster Cup, which is caus
Coleosporium senecionis. This fungus
which grows in different plants during
ing periods of its life-history. One k
spores is produced on Pines, and this
spore germinates on various plants
Senecio genus, such as Groundsel, Ra
and also cultivated Cinerarias, and pro
rust. We frequently get the rust sent
office causing trouble on Cinerarias.
plantation is a young one you should b
to control the disease by clearing o
weeds that are in the Natural Order
positæ and using a spray fluid su
Bordeaux Mixture on the affected trees
fungus is perennial in the tissues of th
foliage, and therefore you should kee
trees sprayed at intervals until all the a
foliage drops. All affected needles sho
raked up and burned. If the above s
tions are practical you should be able
trol the disease.

Name of shrub

(W. R. Y.).—Lonicera pileata, a pe
hardy Chinese shrub of dwarf and co
growth, excellent for clothing a sunny
where its bright purple berries are of u
interest. It seems curious that such a
subject, when grown as a bush, sho
capable of reaching several feet in
when trained to a wall in a green
There is, however, no doubt whatever
its name, as a similar piece sent for iden
tion from the same locality last year ha
struck and grown into a nice bush.

FRUIT

tmaston Duchess

ennington).—While it would be ad- thin the fruits somewhat we would se reducing to but one to a truss. here are three or four, reduce to two, think that a tree of that age will ' these nicely.

ed Peaches

W. Yates).—The Peach leaves sent nination are badly attacked by Red nd this pest is the cause of the leaves To keep the foliage of Peaches it is essential that the trees are twice daily, morning and afternoon, hen the trees are in flower and when is ripening. If this is done Red an be kept under control, and a bad f Spider shows that syringing has glected or that the work has been one. With a tree in the condition yours appears to be you had better supply of " Volck," details of which find in our advertisement columns. , of course, use the material accord- e makers' directions. In addition to " syringe with plenty of water on rable occasions.

owers dropping

ben).—We have examined your pecimens and there is no trace of in- ungus trouble, and we can only con- at frost is the cause of your trouble. Todleben Pear has the reputation of free cropper. Does your garden lie hat late spring frosts are a feature ing? If so, it would explain the dropping each year. Try giving the ressing of sulphate of potash now at of 1 oz. per square yard, and follow y giving an equal mixture of kainit slag next winter at the rate of 6 ozs. re yard. This treatment may help s to set a crop, but if frost is the othing can be done.

Caterpillars

urtmore).—If you will send us along the caterpillar concerned, together ew specimens of the weevil, we could them for you and be in a better posi- advise. Your grease-bands and the wash should have controlled Winter terpillar, but it may be that some oth is the cause of the trouble. the trees with a solution containing enate would kill the caterpillar and weevil from eating any more of the If you do not care to use lead you could use a non-poisonous wash, Abol Insecticide.

Aphis

. Howell).—Your specimens arrived ttered condition, which makes ex- n difficult, but the trouble is un- y due to aphis. Which aphid it is unable to say, because we could not ving specimen. From your descrip- think it is Woolly Aphis. You can- better than to carry on with your wash, especially in August and Sep- or if the trees are carrying fruit, im- y the fruit is picked. Any aphis the white, fluffy material that are on al wood of the tree should be painted equal mixture of methylated spirits ter. Try using a tar oil wash in n addition.

opping their fruits

., Wilts.).—This is probably due to s having been kept in too dry a con- arlier in the season when the fruits un swelling. Figs are very fond of lime in the soil, and if this is not present we advise you to apply a light sprinkling when watering the trees, and in winter work in a quantity of old lime-rubble with the soil of the border. Of course, a severe check in temperature will bring about the same trouble, but we presume this has not occurred. Give abundant supplies of water during the growing season, and if the trees are carrying a good crop the manure you mention may be applied fortnightly with advantage.

VEGETABLES

Dolphin and Broad Beans

(Curious).—Black Dolphin, or Black Fly (Aphis rumicis), is a pest which clusters in the tops of plants, and, if undisturbed, soon forms a solid black mass. The attack is begun by a few wingless female insects which produce living young without the intervention of eggs. Winged females are yielded among this brood, and eventually the egg-laying female is produced towards autumn which lays the eggs from which the spring generation of living young producers is hatched. This pest is invariably referred to by gardeners and farmers as Dolphin, Black Dolphin, etc.

Diseased Tomato

(R. R., Durham).—From the material you sent it is impossible to determine the real cause of your trouble. If you can send us a complete fruit truss, together with a portion of the main stem of the plant, we could examine it and report later. Please pack the specimens in a tin box.

MISCELLANEOUS

"Flannel Weed" in pond

(T. E. G.).—Copper sulphate is used at the rate of 2½ ozs. per 10,000 gallons of water, and at this strength should not injure Water Lilies and other established plants, and it is also stated that fish, other than trout, are not affected by the copper. To calculate the cubic contents of the pond multiply together the length, breadth, and average depth and then multiply the result by six. The figure so obtained is the approximate number of gallons contained in the pond.

Weeds in leaf-mould

(A. M. M.).—We know of nothing that would destroy either seeds or roots of weeds in your leaf-mould but what would make it unfit for use. Strong heat would, of course, be effective, but if you tried to burn the mould the whole thing would be consumed. If you could treat the whole with water at the boiling point that would certainly destroy both seeds and roots, but this would be a costly item. We have heard of a steriliser for soil, the process being to force steam through large masses of earth, but have not seen this in operation, so would hardly care to recommend it.

Plant for name

(A. W. B.).—Your plant is the Yellow Goat's Beard (Tragopogon pratensis). This plant has a perennial tap root and obtains its common name from the supposed resemblance of its fluffy seed-ball to a goat's beard. We think you were misinformed when you were told that the plant is poisonous,

From
Gardening Illustrated

Fifty Years Ago

Sprays for the hair

THAT natural flowers in the hair have a far more pleasing effect than artificial ones is almost too well-known for me to draw attention to. They would be much oftener employed, I have no doubt, were they not apt to flag when not mounted properly, and so the general idea is that they last but a short time fresh when placed in the hair. If however, a little care be taken with the mounting, they will look quite as fresh at the close as at the beginning of the evening. . . .

The shape of the sprays change, of course, according to those formed of artificial flowers; but I always like them best of rather a long form, and as light and graceful as possible. At this season some of the best flowers for this purpose are obtainable; as, for example, Orchids, Camellias, Eucharis, Cyclamens, Lily of the Valley, Roses, Spiræas, Stephanotis, Azaleas, and many others which space will not allow me to enumerate.

I saw two sprays a few days ago which I admired very much at the time. . . . One was composed of a Eucharis, pink Hyacinth pips, blooms of Stephanotis mounted singly, pink Heaths, Lilies of the Valley, and foliage; the other of a white Camellia, scarlet Pelargonium pips, Snowdrops, and very small sprays of white Lilac and Ferns. The flowers in these sprays, save the Eucharis, Lily of the Valley, and the Pelargoniums, could not be obtained during the summer months; but there are many others then to take their places, such as Roses, Jasmine, Gardenias, Stephanotis, etc. . . .—May 31st, 1879.

either to humans or cattle. The tapering tap root was formerly eaten as we now eat Parsnip, and the young growths used to be cut up into lengths and boiled as we now treat Asparagus. The plant does not figure in the Ministry of Agriculture's Book on Poisonous Plants. We think, perhaps, the plant has been confused with some other plant. An allied species, Tragopogon porrifolius, is Salsify, or Vegetable Oyster.

Pronunciation of plant names

Would you kindly give me the correct pronunciation of the following plant names: 1, Aristolochia; 2, Daphne; 3, Erigeron; 4, Geum; 5, Gypsophila; 6, (Prim.) Malacoides; 7, Œnothera; 8, (Betty) Uprichard?

J. Dunn.

[The proper pronunciation of many plant names is a stumbling block to a considerable number of gardeners and amateurs. Some names are derived from the Latin language, others from the Greek, and as in different countries (in Scotland and in England, for example) the accepted pronunciation of Latin and of Greek varies, it is difficult to be dogmatic on the question. "Much depends on the taste and fancy of the pronouncer," slightly to parody Mr. S. Weller. Aristolochia is pronounced "Aristolo'chia"—the "ch" having the value of the same two letters in the Scottish word "loch." Daphne is pronounced "Dap'hne"—phonetically "Daff'nay." Erigeron is "Eri'geron" with the "g" hard, as in got. Geum is "Ge'um," also with the "g" hard. Gypsophyla is "Gypso'phyla," likewise with the "g" hard—phonetically "Gipso'filla." "Malacoides," in P. malacoides, is "malacoi'des"; many pronounce the word "malacoi'dees," and not incorrectly. Œnothera is usually pronounced "N'othera," the diphthong melting into the succeeding letter. [illegible]richard, in Betty Uprichard, is "Up richard"; the name is a Welsh one, signifying "son of Richard," and "Up" has the same value as the Scottish "Mac" or the Irish "O'." "Uprichard" is exactly the same as "Pritchard."]

Fish pond

I believe it is unsafe to put fish into a newly cemented pond unless the cement has been treated in some manner.

F. E. Grattan.

[We have never heard that a new cement tank required any special treatment before placing in fish, but we are publishing your letter in the hope that some of our readers may be able to give you the details of any treatment if such be required. You will, of course, get some water plants established in the pond before introducing the fish, otherwise the fish will not live long, unless the water be frequently changed, and even by changing the water keeping the fish alive is not an easy matter unless the tank is very large and the number of fish small.]

Calcium carbide

(Winton).—The refuse from calcium carbide is calcium carbonate, *i.e.*, chalk, and could be used for any purpose for which chalk is required. The drawbacks to the use of the material are twofold. (1) As the material comes from the generator it is usually very wet, and on drying becomes very hard and lumpy, which makes even distribution almost impossible. Lumpy samples of this material are useless in the soil, but if crushed before application this objection is surmounted. (2) When the material comes from the generator there usually remains some acetylene in the refuse. It is therefore wise to leave the material for some time to air before it is used. The material could do no harm if allowed to dry, crushed, and then added to the manure heap, but we are doubtful if the material is worth the labour involved.

NAMES OF PLANTS

Northerner.—Lonicera Morrowi.

M. Teesdale.—Viola munbyana.

E. F. Hereford.—1, Mimulus Burnetti; 2, Veronica gentianoides; 3, Piptanthus nepalensis; 4, Corydalis cheilanthifolia.

H. B., Sheffield.—A variety of Nerium (Oleander).

W. G. C.—1, Potentilla fruticosa; 2, Coronilla emerus; 3, not recognised, please send when in bloom, and fruits if possible; 4, this is a Veronica, but which we cannot say without flowers.

H. Simons.—1, Iris Albert Victor; 2, I. gagus; 3, Achillea Herba rota.

Inquirer.—1, Cotoneaster Simonsii; 2, Euonymus japonicus; 3, Rhamnus alaternus.

Albert E. Greene.—Primula cortusoides.

The Salisbury Gardeners' Society visit Clarendon Park

On Monday evening, June 3rd, at the kind invitation of Mr. and Mrs. S. R. Christie-Miller, over 100 members and friends of the Salisbury Gardeners' Society, accompanied by their Vice-President, A. C. Jonas, Esq., Mr. S. W. Tucker, Chairman, and Mr. W. F. Gullick, Secretary, spent a delightful time in the grounds and gardens [illegible]ndon Park.

[illegible] me of Christie-Miller is so closely con[illegible] with [illegible]rticulture, that rarities were an[illegible] even the most sanguine of the par[illegible] expected to view so great a variety of [illegible] hs, and [illegible]nts amid such a glorio[illegible]

[illegible] and Mrs. Christie-Miller, [illegible] gardener, Mr. G. Perryman, met the [illegible] on arrival, and [illegible] conducted them on a tour of inspection [illegible] wood-land and winding pathways, where mas[illegible] of hybrid Rhododendrons and bold [illegible]ings of Viburnum tomentosum and V. Mareisii, with occasional rich red Maples, were to be seen, to the dell and wild garden, which less than 12 months since were banks of Nettles, and now a veritable paradise. Cunning water-ways and miniature lakes, banked with thousands of Primula japonica, pulverulenta, and Bulleyana, with here and there masses of Primula Aileen Aroon, helodoxa, and Bartley's Pink, portrayed a feast of colour. Here, too, hundreds of heads of the rare Iris lævigata were to be seen casting their beautiful reflection in the clear water, while high up on the banks, grand specimens of Cytisus Donard's Seedling, Weigelia Eva Rathke, just coming into flower, and arching sprays of Tamarix, Berberis, and Gunnera, combined with a setting ordained by Nature, made a picture which will live in the memory of those present.

Reluctantly leaving this enchanting spot, attention was drawn to splashes of colour in the distance, which were found, on nearer approach, to be large specimen Rhododendrons: Rhododendron Corona, Mrs. Stirling, Goldsworth Yellow, Doncaster, etc., and a number of species, including a fine plant of Falconeri, all in beautiful condition.

Proceeding across the terrace front, still gay with Wallflowers, to a wide border of choice shrubs, we noticed fine specimens of Rhododendrons Cinnabarinum and Loderi just passing out of flower, and the finest specimen Azalea coccinea speciosa it has ever been our privilege to see. This plant, backed by a giant Rhododendron ponticum, produced a wonderful effect, startling, yet beautiful in its conception.

From here to the Iris garden, although less than 12 months old, w with many choice varieties. Beautiful of Iris Majestic, the lovely pink Aphrodite, and the deep violet-purple de Mme. Gaudichau were in splendid Other outstanding varieties were: E Dream, Alcazar, Lord of June, and group of the maroon and yellow Iris K

Through a gateway in a wall, herbaceous borders, which a little lat undoubtedly look resplendent with thei plantings of Delphiniums, Papavers, etc., Lupins were making a brave Never have we seen Downer's Delight to better advantage.

The kitchen garden is by no me prominent feature at Clarendon Parl even here, under the skilful managem Mr. Perryman, who undoubtedly belie good cultivation, are some excellent coming along.

Judging from the healthy batch of se Lilies in the frames, including a num the rare Lilium centifolium, we imagi a few years hence the woodland wa Clarendon Park will not only contain Rhododendrons, but groups of Lilies. tainly a more delightful spot for g them to perfection it would be imposs find.

The gardens did not curry any f during the Great Frost. Effects of the age were apparent in many choice s A giant Magnolia salicifolia (probably the finest in England) is completely dest while one large Abutilon vitifolium ha killed and another specimen is just br at the base. Pittosporums have als fered, but with a gorgeous display of so beautiful shrubs and plants, these loss hardly noticeable to the visitor.

The thanks of the Society were co Mr. and Mrs. Christie-Miller and [illegible] Mr. Perryman, through Mr. [illegible] and Mr. W. F. Gullick, for a most [illegible]

The Jones-Bateman Cup for Re in Fruit-growing

In 1920, Miss L. Jones-Bateman, Glass, Abergele, presented to the Horticultural Society a valuable sil replica of the Warwick Vase to be us the encouragement of fruit production accordingly decided to offer it triennia researches in the growing of hardy Figs, Grapes, and Peaches in the o under glass, and it is available for aw 1929. Candidates should submit accou their work by October 31st. The work with must have been carried out by the date in the United Kingdom mainly the past five years. The cup will b for three years by the successful can who must give a bond for its safe retur when the cup is relinquished the hold receive a commemorative gold medal. holder will be eligible to compete on th or any succeeding occasion. The As will be three, two appointed by the Horticultural Society and one by the N Farmers' Union, and they will report Council of the Royal Horticultural upon the originality and comparative tial value to the fruit-growing indus the work of the candidates.

Peaches ripening

A little air should be left on at the houses containing these, both night an and the atmosphere kept a little drier th late. Any foliage which tends to obscu fruits from sunshine must either be tie or removed.

Plan next Season's Garden NOW

Of course, you aren't entirely satisfied. Lovely as your garden is, it lacks something, a central point of interest, an element not supplied by mere spade work and planting. What it needs is:

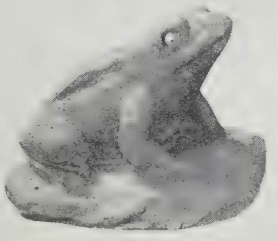
A 'LEFCO' GARDEN ORNAMENT

Sundial No. 22
PRICE 45/-

"Lefco" Garden Ornaments are designed for the amateur gardener—and therefore their prices are extremely moderate, ranging from 15s. upwards. For every garden and for every part of every garden there is a suitable model—Fountain, Bird Bath, Sundial, Vase, or quaint and pleasing figure.

"Lefco" ornaments are not expensive, and they are imperishable. Year after year your garden will grow up around them, while age only mellows them to a more pleasing beauty.

It is impossible to describe the charm of these delightful ornaments, but the fully illustrated book giving countless hints for the beautifying of your garden and listing the complete range of over 50 ornaments, at prices from 15s. will be sent you post free on request. It is a valuable book. Send for it to-day.



Special Sample Offer
"LEFCO" Miniature
Figures. No. 1.

THE FROG
PRICE
2/6
Post
Free

This quaint "Lefco" piece stands 3 in. high. In addition to its use in the garden it forms a really admirable paperweight or mantel ornament. Made of the famous "Lefco" Ware, it will not crack; a wipe with a damp cloth will remove any dirt. Charming, useful and very low in price. Obtainable only from the makers. See the mark on every piece of "Lefco" Ware. It assures you that it is genuine and British made.

Notes from the West

IT is extraordinary how certain plants become popular in some districts whilst they are comparatively ignored in others. The tility of Cheiranthus Allionii for massing is vell understood here. In some gardens this howy orange-flowered plant has been making gorgeous displays for several weeks. The iberian Wallflower, as this plant is popuarly called, should always be grown where rilliant splashes of colour are desired. It as remarkable freeowering qualities, nd the flowering eriod may be conderably extended by utting away the ooms before they un to seed; moreover, it can be grown uccessfully in most dinary garden soils. ow is a good time sow seeds for next ar's display, and the edlings can be ised in the same ay as the common allflower. Another cellent plant for assing is Nepeta ussini. A large und bed on a sunny wn filled with this nt is making a utiful display in a ghbour's garden t now, and in other garden there some fine groups vering abundantly he shade of trees, ch goes to show ht this Catmint is fastidious as to re it is planted. colour of the ers — a pleasing le of lavender-, is a most deble shade for ssing. As an edging to large borders N. isini is also much appreciated. The stock be increased by taking cuttings during t summer. These will strike readily in ary beds in a shady border outdoors or in d frame.

ses are full of promise, and I have never e the foliage looking so glossy and green ree from pests, in spite of dry conditions. ythrum blooms have been very small herects owing to the dry weather, but the er rooting perennials look more promisg. May-flowering Pæonies have been doing bravely, and in another 10 days or so the June-flowering varieties should be at their best. These plants can stand any amount of drought, provided they are planted in a generously manured and deeply dug soil.

A striking show in the garden this week is made by the Anchusa Dropmore. This plant yields its rich blue flowers profusely in dry weather, as the roots delve deep in search of moisture. I notice many gardeners omit to stake their plants, and the first strong wind quite spoils their beauty for a season. I always put pea sticks in between the branches. These do not show, and they make an admirable support. I always find that plants in partial shade last much longer in bloom than those in full sunshine.

My garden note-book in the summer consists largely of notes of the various colour effects I see in my own and in other folks' gardens, and I commend this habit to any novice who should read these random remarks. So many amateur gardeners plan their colour effects from catalogue description perused by the fireside during winter, and that is why their best laid schemes "go aft agley." Beds and borders are often ruined by careless arrangement as regards colour. Another point to be observed in colour scheming is to study lighting effects. For example, some flowers, like Kniphofias, generally give the best effects when they are placed so that the rays of the westering sun falls across the flower spikes, whilst the beautiful pale yellow of the Œnotheras usually look most charming when seen in the shade. Finally, when assessing the value of any colour it is generally advisable to form your judgments in the evening when the strong sunlight is not playing on the blossoms. Most colours are seen at their best in a subdued light. H. G.

Eremurus, a noble group of hardy plants

These graceful flower spikes are from 6 feet to 10 feet high

Eremurus, or the Fox-tail Lily

NO sheltered garden is complete without a group—large or small—of these early summer flowers. The noble graceful spikes, from 6 feet to 10 feet high, are certain to arrest attention. The colours, too, are delightful, some of the newer hybrids in soft shades of pink and yellow harmonise beautifully with many of the paler colour tones in early summer flowers. Eremurus robustus, the best known and one of the finest, has pale rosy pink flowers which are seen to advantage against a background of trees or shrubs. All of them revel in deep, rich loam. Autumn is the best time for planting.

Horticultural Club outing

Arrangements have been made for an outing of the Club on Friday, July 5th. By the kindness of Messrs. J. Cheal & Sons a visit will be paid to their nurseries at Crawley, and after lunch the party will proceed to Nymans, the residence of Lieut.-Colonel Messel, to inspect his beautiful gardens.

On arrival at Crawley, Messrs. Cheal will kindly provide refreshments, and lunch will be served at the George Hotel, Crawley. Lieut.-Colonel Messel has kindly offered to give us an alfresco tea on the lawn at Nymans.

The journey will be made by motor coaches from Bush House, Aldwych, at 9.45 a.m., and the return journey will be made about 7 p.m.

Application for tickets, price 10s. 6d. each, should be made not later than June 30th.

Geo. F. Tinley,
Hon. Secretary.

St. Ermin's Hotel, Caxton Street,

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

A proposed Rock Garden Society

THE success of the Rose Society, the Rhododendron Association, the Iris Society, and their delightful shows makes me wonder whether the time has not arrived to organise a Rock Garden Society.

Now that all the world gardens, the interest taken in small hardy plants is immense, and people bring them back in great numbers after their holidays.

I can envisage the show of the Rock Gardens Society in the New Hall. The nave would be filled with rock gardens constructed on correct lines by the trade, whilst the aisle could be devoted to amateur exhibits—six pots or pans of Kabschia Saxifrages, six pots of Aizoon Saxifrages, groups, new plants, etc. Other activities would comprise a nomenclature classification committee, advice as to collecting grounds, lectures, exchange of plants and of seeds. All these matters would be dealt with in bulletins.

I hope the Editor will bless my suggestion and that the readers of Gardening Illustrated will prosecute actively the proposal.

William Lawrence.

[A capital idea. Such a show is bound to be a success. We welcome expression of opinion from others on this suggestion.—Ed.]

An early purple bicolor Iris on a sunny bank

Azalea Mollis

Two acres of them; literally a sheet of bloom! This does not convey my astonishment and admiration for an unexpected treat I experienced on June 9th. At the instigation of a high official of the County of Norfolk, I betook myself to the woodland garden at Stody Lodge, Norfolk. Unannounced I opened one of the drive gates and took my car along a beautifully kept plantation of Fir trees, bordered with Rhododendrons. Suddenly I saw a notice board: "To the Water Garden." Here, thought I, must be the place I am seeking. Descending a winding path, a vista opened before me which I shall never forget.

In an open place of two or more acres of undulating land, intersected with small streams in the wood, the owner, R. E. Horsfall, Esq., has established such a plantation of Azaleas as I very much question if a better display could have been found anywhere in the British Isles.

A riot of colour, yet seemingly all in perfect blending, embodying all the latest introductions and self fertilized seedlings.

Thousands of *flowers!* Yes; thousands of *trusses*, and, I think, taking individual flowers, one might safely say millions of flowers.

Self sown seedlings come up all over the place in profusion. Of these, certain reserve plantations are made year by year, and as Mr. Horsfall was a former President of the Norfolk and Norwich Hospital (in which he takes a keen interest, although a slight affliction prevents him taking an active part), when the plants reach a fair flowering size they are sold for the benefit of that institution.

In my walk round the garden I came across the owner and talked with him on the glories of the flowers. He told me he is pleased for visitors who are interested to come and see them upon a request, and exercising due respect to the place. He introduces the "newest out" from any source year by year, and thus keeps up to date in varieties. My one regret was, Mr. Editor, that I could not foresee such a wonderful picture of flowers and reflections conveyed in colour to your readers in other parts.

Aytch Pea.

Positions for Iris

"H. H. W.'s" experience (issue of Jun 15th, p. 414) differs from mine. Th Irises about which I wrote are grow on a made sloping bank. I made it up tw years ago. Fibrous loam about two parts, on part burnt earth and ballast, and one par mortar rubble and sand. This would b about 3 feet deep at back and 2 feet i front, banked up with thick turves. Th whole bed, about 35 feet, slopes sharply t a pond. There is no question of this becoming damp, the difficulty is to get it thoroughl saturated. All plants affected (which I du up and burnt) were of the older type, Fr Maori King, etc. Similar symptoms ar showing in Sunshine, which I propose t treat with the 2 per cent. formalin solutio

I think the cause of the trouble w weakening of my stocks. When I moved this house I brought a lorry load of variou plants, and they had to take pot luck un I prepared beds. These Irises formed par The trouble commenced the spring followi planting in permanent position. Later pu chases, as Ambassadeur, Archeveque, et have formed fine clumps and gave a glorio show of flower.

By the way, I have lost one clump of Kæmpferi and one clump of I. Sibirica dying. The symptons appear to me ve similar to those of the aforemention These are growing in a properly made b by the pond verge.

I shall try the formalin treatment on and hope to get these most beautiful flowers back to normal health.

Hornchurch. H. J. Hastings

Iris germanica

This type of Irises seems to be me profuse than ever this year in sending p flowers. Is it due to the extra retardat they received in the severe winter or baking they received in the dry autumn? It was my pleasure to inspect one of the choicest small collections of a private gro in Norfolk a few days ago in the garder of Frank Neave, Esq., Lingwood. I need not dilate a long list of names, suffice it to they were the pick of the latest English American varieties.

But Mr. Neave is never so happy as when he can show one plants in flower hybrid and raised by himself. He stood me be some plants of extra robustness carr spikes a yard high, with flowers of imm size and splendid combinations of colo purple and lavender predominated. Mo these will be heard later when a stock as been worked up.

H.

Norwich.

Polyanthus

Having produced such wonderful hy from Juliæ as Lingwood Beauty,

e clump of Pæonia Mlokosewitschii in Dr. Hampton's garden at Chesham Bois
scovered in the Central Caucasus by Mlokosewitsch, and unfortunately named after him

Neave, and now the large-flowering Neave, I found that Mr. Frank Neave, od, is extending his sphere to produce e designates Art colours in these . I saw a bed of seedlings when they full flower in April, and really the e already made were wonderful. Deep ,terra-cotta brown, and other colours these are already an established fact. e the flowers at all miffy in size or nts weak of constitution.

only the best that Mr. Neave gives o in his garden. Some day in the ture I anticipate a call from many s for the Art shade flowers.

AYTCH PEA.

Conandron ramondioides

i pretty little plant is but rarely grown, it would add not a little to the interest auty of the rock garden. The some- ucculent, wrinkled leaves are arranged tufts and are coloured an attractive of pale, fresh green. The erect flower- s are about 6 inches high and each several mauve or mauve-purple . Flowering in late spring and early r this little Japanese plant will re- to treatment similar to that accorded mondias and Haberleas, and will ad- ly display its charms from the crevice ock or from a cool pocket in a half- e position on the rock garden. The is tolerably hardy, but during very r weather it may be wise to afford it a rotection, such as a piece of glass or a handlight. A good depth of moist soil ing some leaf-soil or peat, and a cool, situation are the chief factors in the ful cultivation of this quaintly pretty lant. RALPH E. ARNOLD.

incester, Glos.

Multiple flowered Tulips

e autumns ago I planted a bed of 25 Sultan. The two seasons following g quite 25 per cent. produced three to wers per stem. I did not notice any ay. H. J. H.

ising, Hornchurch.

Pæonia Mlokosewitschii

PÆONIA MLOKOSEWITSCHII, the fine yellow Pæony that received an Award of Merit at Chelsea this summer, is not altogether a new plant, for it was figured and described in 1908 in the "Botanical Magazine" (No. 8,173), where we learn that it was discovered at Lagodekhi in the eastern part of the Central Caucasus by Mlokosewitsch, and, unfortunately, named after him.

It is a pity that it is not seen in gardens more often, for it is a finer plant than the better known and more pronounceable Pæonia Wittmanniana, from which it differs in the clearer yellow of its sulphur-coloured flowers and in the absence of the brownish-red which stains the base of the stamens in Wittmanniana. It seems to be quite vigorous and hardy, for a plant here, though it is within reach of the hungry roots of a Laurel hedge, is now, in its fifth year, about a yard across and carrying 13 or 14 flowers.

The flowers have the disadvantage, common to most large, single flowers, of being rather short-lived, and the hydridists would be doing us a good turn if they could add another row of petals without impairing the natural grace of the species. Such an addition would improve the pleasant, clove-like scent of the flower, for this, according to the general habit of Pæonies, is produced only by the petals and tends to be marred by the coarse, poppy-like smell of the anthers.

Although the flowers are rather fleeting, the ample, pale green foliage is very handsome, and when the seed pods split open the black, fertile seeds are usually decoratively mixed with infertile red ones, as they are in the closely related P. corallina.

Chesham Bois. F. A. HAMPTON.

Meconopsis Baileyi

I fully agree with the remarks of "Sarah Robson" (issue June 15th, p. 414) *re* M. Baileyi. "Glorious" is the only adjective by which to describe its charm. A clear Cambridge blue with me, not a trace of mauve, and as for looking the "wash-out" of "J. R. K."—well, I wish I had a bed *full* of such. True, I have only tried with three (one died last summer), but I sincerely hope these will give me fertile seed that I may work up a good stock. They were planted at the edge of a bed of Liliums and Azaleas; no shade at all. I gave a top dressing of clean gravel, and later, mulches of lawn mowings. A shovelful of leaves over the crown in autumn completed all the cultivation given. I have no doubt with a more generous treatment far better results will be obtained, as they are only 2½ feet to 3 feet in height. H. J. H.

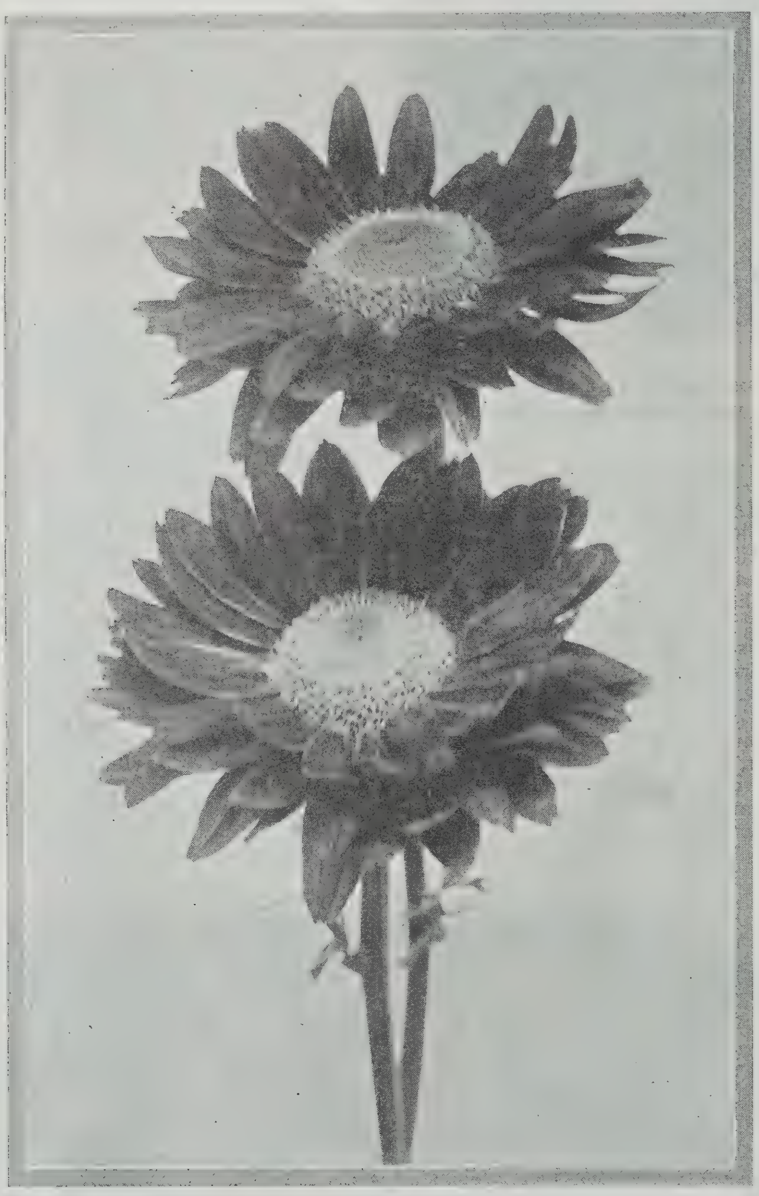
Hornchurch.

—— Having read "Clay's" and "J. R. K.'s" letters on this plant, which should be known as M. betonicifolia (but can we forget "Baileyi"?) I was anxious to see how the plants would fare with me. I have

A nearer view of Pæonia Mlokosewitschii
The flowers are clear sulphur-yellow with pleasant clove-like scent

between 500 and 600 plants in flower now. I do not think a single plant was lost during the winter, and they had no protection whatever. They are planted in slightly raised beds, partly in the shade, and others in sun for the greater part of the day.

The beds were trenched two spits deep, the plants put in last June or beginning of July. The first lot of plants were planted without any leaf-mould in the soil, and it was only after these were in that I found it had been omitted. I then had plenty of leaf-mould added and dug in; this part stands in the sun for the greater part of the day.



Red Emperor, a new large, bold, single Pyrethrum, shown at the last meeting of the R.H.S. by Mr. Herbert Robinson, of Hinckley, and selected for trial at Wisley

A very robust grower, the broad ray florets are of brilliant velvety crimson colour

The plants to-day in this part stand up to 4 feet 6 inches in full bloom, 99 per cent. pure colour, and this in spite of a very dry season ever since the New Year. Those in the shadier parts from the same seed that had no leaf-mould are decidedly inferior. Obviously a matter of position and cultivation. I think this shows that colour is largely a matter of good cultivation in congenial surroundings. The plants in shade do not exceed 3 feet 6 inches, and show less vigour all round. One might describe it as a case of anæmia and lack of sunshine and food at the roots. Elsewhere I have a few plants which get a great deal of sun during the day, and though they were very small and late, being put in during the latter part of August, yet they have flowered perfect in colour. I am quite convinced that any lack of uniformity in colour here is due to conditions of cultivation. I am only sorry that "Clay" and "J. R. K." have been so unfortunate with such a glorious plant. Possibly some readers may have seen my plants and can endorse what I say. I had not tried them as cut flowers, but I cut two or three spikes and gave them to a friend to paint. He put them at once into water and took them home—a motor drive of two hours or more. He wrote and told me that the heads flagged more and more, and I concluded that there would be a quick end to them, but a week or more later I had a letter from him saying they had revived, and that, as he wrote, they were as good as when I cut them. G. H. Dalrymple.

Hants.

A new colour chart

Some correspondence has appeared recently in these columns on the subject of colour, with regard to colour descriptions in catalogues, and the necessity of a standard colour chart to regularise the same. I would, therefore, like to bring to the notice
of those readers interested in this s
new publication, "Colours: Chart
Catalogued," by E. Fellowes, whic
all the qualifications required of a s
colour chart.

As such, it stands in a pre-eminent
It contains 400 hues of a scientific ex

Dove Orchids

AT the R.H.S. meeting of June 11th a ood example of the old, but now un- ommon, Dove Orchid was staged by . Thurgood, Orchid grower to S. G. on, Esq., of Shepperton.

isteria elata was first introduced in 1826. ently at that time, and for many years e it was fairly common in its home— anama district—but is now said to be e and becoming more so as larger c of country are brought into cultivation.

A rt from its flowers, the species is able for its stately habit, tall plicate s, often over 2 feet in height, surmount- a globosely conical pseudo-bulb, often hes in diameter. The erect scapes ex- the leaves by 1 foot or 2 feet, and carry 15 blooms.

e flowers themselves are 2 inches, some- more, sometimes less, in diameter. The s overlap the slightly smaller petals.

are of thick, wax-like texture, concave eir inner surfaces, so giving the whole r a broadly campanulate or globular a; cream or ivory-white in colour.

e lip may be likened to a short, but very l, tongue, reflexed at the tip, slightly the sides, and with a thickened convex surface. The front portion resembles epals and petals in colour, but the base otted with purple. The organ is cap- of slight movement.

e name Peristeria—a dove—is given to genus on account of the shape of the nn. All members of the genus are alike is respect, but in elata its resemblance e upper part of a dove is most marked. head and beak imitated by the column is slightly down-bent. From the base e column rise two wing-like lobes, white, ly spotted with purple, the "dove" unspotted.

e illustration shows the dove and its s nestling, as it were, in the centre of lower.

ewing a flower from the front, one can ily understand how the name was ed, and why the early Spanish settlers adventurers termed the plant El Spiritu o, or Holy Ghost plant.

additional attraction is found in the ptible fragrance emanating from the r.

regards culture, the plant is not exi- . Coming from Panama, it naturally ires a warm house, particularly during growing season, but an ordinary stove e where Codiæums (Crotons), coloured ænas, etc., are grown has a sufficiently temperature.

the species is strong rooting, a fairly pot may be used, and the compost ld consist chiefly of good fibrous loam, sufficient Osmunda fibre and Sphagnum s to soften same and keep it open.

with Calanthes, avoid syringing the t while the young leaves are enfolded. r growth is matured, water need only ccasionally given, but sufficiently often event the pseudo-bulbs from shrivelling; act, the treatment may be said to be a ified form of that given Calanthes, gh the plants should remain in the warm se throughout the year and need not be tted every spring.

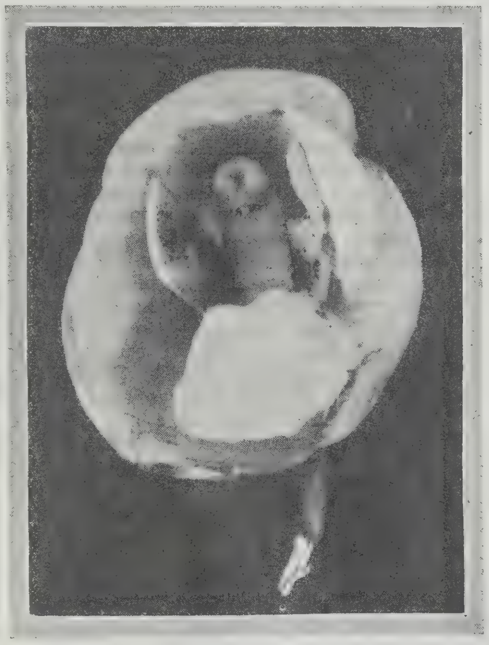
quite a different genus—Masdevallia— und another Orchid, to which the name risteria" has been applied, though in case as a specific, not as a generic, name, again from the same reason: the strong mblance to a dove seen in the flower.

he species has a tufted habit, with fleshy es, attaining a height of 5 inches or 6 es. The scapes are about the same length and produce a single flower, large for a Masdevallia. The basal portions of the three sepals are formed into a bell-shaped tube, but each develops into a yellow tail an inch long or more, and reflexed, so giving a good view of the top of the column, on either side of which appear the petals, acting as wings. In Peristeria the wings are parts of the labellum. In colour the flowers of the Masdevallia, though not brilliant, are more ornate than those of the Peristeria. The outer surface of the tube is green, shading into yellow, while purple spots are present below the tails, and the lip is thickly studded with amethyst asperities.

Other than the general structure common to all Orchids and the fancied resemblance to a dove, there is little affinity between the two plants, and the Masdevallia must be accommodated in a cool house and never allowed to get dry.

The Flying Dove Orchid

An old-time Orchid still occasionally met with is Oncidium candidum, in earlier days better known as Palumbina candida, and also as the Flying Dove Orchid.



The Dove Orchid (Peristeria elata)
Note the dove with wings nestling, as it were, in the centre of the flower

The habit is that of the average small Oncidium, but it differs from other members of that genus in that the lateral sepals are connate and, at a first glance, hidden by the lip, that organ being the largest of the segments. The slender wing peduncle bears six or seven flowers, rather more than an inch in diameter, white or faintly rose-flushed in colour. The petals, representing the outspread wings of the dove, are carried at right-angles to the small dorsal sepal and larger, bluntly triangular lip.

The comparison of the inflorescence to a flight of doves is not inapt.

Like the Masdevallia, it must be grown in a cool house, but succeeds better when hung near the glass, and though it does not appreciate the drastic rest necessary to some Oncidiums, it should be carefully watered in the winter and the compost never allowed to become water-logged.

Yet another Orchid, again from a different genus, may be included here, though the vernacular in this instance is the Pigeon Orchid, Dendrobium crumenatum, a species widely distributed throughout the East from Burma to Java.

In certain, if not all, localities it is said to flower with such regularity that the week, if not the actual date, may be told by the appearance of its blossoms. Crumenatum = pouch stemmed, the plant having its pseudo-bulbs swollen for the first few inches. They then elongate into a reed-like extension often 2 feet or more long, and branched. On these slender prolongations the flowers are carried, great quantities being produced in their native haunts. They are greater in length than in breadth; soft white or flushed with rose is the usual colour, but yellowish forms have been reported.

The resemblance of a single flower, to me, is nearer to that of a bird in the act of settling, or rising, rather than to one in flight.

Though it is said to flower so freely abroad, so much so that the jungle is quite coloured by the number of flowers, under cultivation, it cannot be termed a first class Dendrobium, a few flowers only being produced at a time, very few to what one would expect from the length of the pseudo-bulbs. This paucity of flowers, added to their ephemeral life, renders the species useless to be grown in quantity, though attractions are to be found in the shape, colour, and fragrance of the blooms. E. COOPER.

Suckers on Rose trees

Quite seasonably, one reads frequently in horticultural periodicals, about this time, instructions and exhortations for the prompt removal of suckers, with notes on the best means of distinguishing them.

But it is somewhat strange to notice that in nearly every case one is told that these suckers should be "cut off." I have noticed it more frequently this year than ever.

To "cut off" a sucker amounts, broadly speaking, to no more than a hard pruning of the stock, the result being largely futile as regards the suppression of the tree's tendency to produce them. However often and diligently suckers be removed by cutting off, more, and more vigorous, will appear. This is true of fruit as well as Roses.

The correct procedure is, of course, to trace the sucker to its source and pull it off (or rather should it not be *out*?). In the case of standards, where the suckers appear above ground, they should be *rubbed out* when quite small. Has no one ever cut off or broken a side-shoot on a Tomato and found another come in its place, whereas, if gently rubbed out the treatment is quite efficacious?

It has struck me that so frequently have these instructions to "cut off" suckers appeared lately, it may save some novices, at least, trouble and disappointment in dealing with growths, which in some soils and seasons are a persistent evil, to have the correct procedure stated for their benefit.

J. R. K.

Window box soil

This should be well drained by a layer of stones and pieces of crock in the bottom. Then a layer of heavy loam to hold the moisture in hot weather, then the balance in loamy soil enriched with bone-meal or leaf-mould. Soil should be porous so water will not stand on top, but do not allow it to dry out.

Dead blooms

Immediately they are over remove these from Azaleas, Rhododendrons, Lilacs, and other subjects which seed freely, and so divert the plant's strength to the production of next year's wood instead of allowing them to become exhausted in maturing a crop of unwanted seeds.

Raising Wallflowers

OTHER flowers may be popular for a time, and then—subject to caprice of fashion—lose favour, but this stands alone without danger of being supplanted, revealing its beauty to us at the high noon of springtime. As is known, it is a biennial of easy culture, thriving in any fairly good soil, without the aid of manure, but needing rather a longer time for growth in some districts than is generally supposed. They never look better than when planted in groups of one colour, and it is true to say that they make the most unpretentious garden an attraction, bringing about a veritable transformation at a comparatively small cost. Like some other old-time garden flowering plants, Wallflowers have been considerably improved during the last 20 years or so, and much of this is due, not to the work of any individual person so much as the enterprise of certain firms.

It is important in selecting ground for the sowing of seeds of Wallflowers that it should be in an open, sunny situation, and free from any recent manure. If possible, it should be a spot clear of hedge or trees likely to shade, avoiding any soil that may have become impoverished by winter greens. Let the soil be well dug, and after having been brought to a fine surface by raking, seed can be sown. This is best done from the middle of May until the end of June in drills 9 inches apart, planting the seedlings out when large enough, 6 inches or so apart. It may be needful to afford these young plants water for a day or two, or even be necessary to "puddle" plants into nursery beds.

I have found from experience that the longer, in reason, one can give Wallflowers for development, the stronger they are in the autumn when it is necessary to plant them in their final quarters. It is unwise to plant them, at any time, in manured ground. To do so will result in a deal of "sappy" growth, which is no indication of their capacity to stand a hard winter. If the ground should be on the clay side, and very heavy, it can be made lighter by the addition of gritty material. It is often an advantage to give Wallflowers two shifts before transferring them to their quarters for spring flowering, one when pricking out as seedlings, and the other after a couple of months have elapsed, but it is mostly a question of opportunity, and space, which each one must decide.

The single varieties are generally chosen because of their greater variety of colour, their good habit, and free blooming qualities, but the doubles are not without charm. The advantage of sowing each variety to itself enables one to follow any plan of planting out in colour groups desired, and in the opinion of many it is the more effective way. The question is sometimes asked whether old plants cannot remain in the ground to do duty another spring. It seems to me that there are several objections to such a course: (1) Because it is not always convenient to allow old plants to occupy the same ground for so long a time without disturbance; (2) old plants have not the same vitality as young seedlings; and (3) it not infrequently happens when old plants are kept for blooming two years in succession that they do not come either true to colour or equal in quality of flowers, inasmuch as bees and other insects have distributed pollen, with the result that flowers are "flecked" and untrue.

In the circumstances it is always the best to start with seed procured from a firm who make it their business to grow for seed, and who, therefore, can be relied upon to sell only that which is pure. From the following a suitable selection can be made:—Blood Red; Rose Queen, terra cotta pink; Eastern Queen, apricot; Primrose Dame, pale yellow; Ellen Willmott, ruby red; Orange Bedder, orange, fading to yellow; Sutton's Fire King, orange-scarlet; Purple Queen, rich purple; Cloth of Gold, pure yellow.

In addition to these there are dwarf or Tom Thumb forms of yellow and blood red which are serviceable for front row planting, and amongst double varieties one may have them in shades of brown, purple, and yellow.

cultivation of Asiatic Primulas in a sunny rock garden

IERE must be many lovers of these ıscinating plants who, because their vailable ground has a southern aspect, :ause the soil is too dry or sandy, fear tempt their cultivation. Being well inted with a garden wherein many s of Primula grow and flower well, ıgh facing south and with a subsoil of ınd beneath, the methods of cultivation ed may prove of use to others.

ıy of the Primulas being natives of and or stream-sides, the chief necessi- ıre shade and moisture at the roots, protection from cutting spring winds ntial.

shade in this garden was obtained by ng small-growing shrubs on the rock n, beneath and around which grew the ılas. The actual shrubs used were icum Androsæmum, Artemisia abro- ı, Cytisus Daisy Hill, Cistus salvifolius, C. florentinus, various Helianthemums, Cotoneaster microphylla glacialis. Be- these, many others, such as Berberis næ, B. subcaulialata, Rhododendron osum, R. ferrugineum, Genista ıica, Euonymus nanus, Spiræa bullata, . Anthony Waterer, would prove effec-

se shrubs are, of course, a partial from the east wind, but a surrounding was most valuable in this respect.

obtain moist conditions at the roots g the summer months, when the plants full growth, thorough preparation of round is the greatest aid to success. hing should be carried out 2 feet deep st or to the subsoil, which should then ked over, but not turned up into the oil. At the bottom of each trench a layer of broken bricks, slates, clinkers, all stones must be spread, so that the ılas may have that proper drainage g the winter which is so necessary for

ve this place a layer of rotten leaves or ed vegetable matter of some kind to le a water-storing material for the days—the drier the soil conditions the this layer should be. Do not use rank re on any account or the result will be h at the expense of flower quality, and will also render the plants less able to withstand the attacks of wind, damp, and slugs.

Primula pulverulenta with an edging of Saxifraga umbrosa at Bodnant
The large Rhododendron in the centre is Rh. calophytum

The surface soil may now be replaced, but with it should be mixed some form of humus, such as old peat litter, which will prevent the surface from baking hard in the summer.

All these materials should be obtainable largely from the various rubbish-heaps in the garden. The peat litter in the original came from a disused hen-shed.

The soil must then be allowed some little time in which to settle down before planting any Primulas. After this has been carried out a thick layer of coarse sand should be scattered round each plant, partly to ward off slugs and partly to protect the neck from excessive moisture, a particularly deadly form of attack to many species. Subject to weather conditions I would suggest late August or early September as the most suitable time for preparation and planting.

Primulas should always be planted so that their roots run beneath a stone, thereby keeping them cool and moist in the summer months. This may be achieved in two ways—first, by excavating a suitable hole under rocks already in position and planting the Primula therein, taking care to break up the soil as far back as possible; and secondly, by first planting and then surrounding the Primula with suitable stones, which should have a flat base and be placed as near to the crown as possible. In either case be careful to keep the plant on the north side of the stone or otherwise the stone will merely reflect the sun's heat on to the Primula. P. Forrestii and many European species are exceptions to this rule.

xed colony of Primulas japonica, helodoxa and Lady Thursby in the woodland at Bodnant, N. Wales.

In the early summer, about June, many of the stronger species will appreciate—and often need—a top-dressing composed of such material as well-rotted leaves or peat litter mixed with the best available soil. This will act both as a mulch and also as a stimulant to the surface roots.

Winter treatment, particularly in the damp parts of the country, should consist in removal of all decaying leaves and in regular applications of sand around the necks of those species above ground. P. capitata and its relatives will need careful attention after frosts or heavy rain, as they are apt to lift gradually out of the soil. In this case they should be gently pressed back and given a good top-dressing.

In the garden under notice the following species proved most successful:—cashmeriana, denticulata and its variety alba, frondosa, Florindæ, glycyosma, helodoxa, lichiangensis, oblanceolata, Mooreana, pulverulenta, and Wardii. P. frondosa in particular excelled, making very large, floriferous clumps and seeding around.

Those species which have proved difficult include Cockburniana and its hybrid Red Hugh, Littoniana, rosea, saxatilis, and secundiflora; however, fresh seedlings have been raised of the last-named species and promise better results.

In conclusion, remember that the finest plants may be raised from home-saved seed sown as soon as it is ripe and *not* in the following spring.

B. O. M.

Primula chionantha

IN your issue of June 8th your correspondent says that this is a biennial but produces seed in great profusion.

I had a seedling of this given me in 1925. It flowered for the first time last year, 1928, throwing up two fine spikes, but gave no seed. This year the same root has again thrown up two spikes, with three whorls of the creamy white flowers, and, I hope, presently may ripen seed.

G. G. BAKER CRESSWELL.

Preston Tower, Northumberland.

Primula microdonta alpicola

The charming Primula microdonta is a most variable species in the colour of its blooms, and the writer has had the pleasure of seeing a number of various colours and shades selected from very many plants and forming in themselves quite an attractive collection of delightful flowers. For the average reader it is sufficient, perhaps, to speak of the charming P. microdonta alpicola, which comes from Southern Tibet, at a height of from 13,000 feet to 14,000 feet above sea level. The form which received the Award of Merit of the Royal Horticultural Society in 1927, when it was shown by Oliver and Hunter, of Moniaive, is about 18 inches high, and from June onwards gives whorls of lovely drooping flowers of pale Primrose, and very fragrant. It is a delightful plant indeed, and in my garden is much admired, although it has as its near companions such flamboyant Primulas as Cockburniana, Burmanica, Red Hugh, and others. Good loam and peat or leaf-soil will suit this lovely plant, but it must have plenty of water when in growth. It frequents shady bogs and the margins of streams in its native country. Increased by seed or division.

S. ARNOTT.

Why one should grow hardy Primulas

I think the man or woman who loves flowers and who has omitted to make the acquaintance of some of the hardy forms of Primulas misses a very great deal of beauty in the early year when everything that blooms is welcome in a garden. That is why I am keen in growing Primulas, known to be hardy, that are little affected by the winter. Just now is the time when seed can be sown in boxes of light soil and placed in a partly shaded place in the garden. It is also the right time when plants can be literally pulled to pieces, and every bit of rootlet planted out 6 inches apart in firm ground and made rich with a little old manure, or at least some old vegetable refuse or spent hops to supply a little humus to the soil. You meet with the complaint so frequently, " My garden gets little sun." That is just the place where hardy Primulas thrive the best, the spot they love. I have some hundreds of plants of Primula Wanda (purple), Juliæ (rose), and others that have been a real delight this spring. If you had seen them in the first weeks in March, when night after night sharp frosts came with regularity, you would not have begged them. There was not a vestige of foliage to be seen, only tufts of brown, withered leaves. In April the leaves began slowly to unfold. In May they were miracles of beauty, as full of flowers as any woodland Primroses. I have not lost more than two or three clumps, and they were old ones which had not been divided. All the young ones which were transplanted last June made nice-sized roots and came through their winter ordeal unscathed. Never before have I seen quicker development; never before have they responded to the influence of rain and milder conditions more than this spring, and those on the coldest part of the garden have flowered the best. Two or three decent-sized clumps split up now will bring, probably, a score or more plants, because every bit with a rootlet will grow within a year into a flowering specimen.

LEAHURST.

Staking Hollyhocks

If arrangements have not already been made to stake Hollyhocks it should be done forthwith, avoiding the use of Bamboo canes, that for strong-growing plants are unserviceable and afford no support in a time of rough wind and rain. A good wooden stake about 1 inch or 1¼ inches square I find the best, and these should be painted green. Tie with twine or cord in preference to raffia, which sometimes gives way when the stems are full of flowers. Should it happen that the plants have been grown from offsets or are old clumps of a previous year the grower should watch very carefully for any sign of fungus disease appearing on the leaves. As a rule, spotted leaves are found near the base of the plants, but not always, as quite young leaves may be attacked; but whenever they show they ought to be at once picked off and burnt. If it is found the disease is confined to one or two plants and begins to spread it is the better policy to uproot such plants and destroy them, as nothing spreads quicker than the rust complaint, which disfigures plants regarded as healthy, in a few days. There is no half-measure once the disease has got hold of a plant, and it is therefore best to destroy it.

d rootstock with the boss of leaves and
rs at the end.
vittata has just opened in a north border,
I was glad to see it, for most of the
s here over-ate themselves, grew like
ges, and died. But these survivors had
uch rich soil and should provide seed for
uture. It is a pretty thing, but not, per-
, of outstanding merit. Serrated Prim-
leaves and a double scape of flowers on
inch stem, crimson-purple, and hanging
ther long pedicels; and both these and
alyx are lightly powdered with farina.
calyx especially is conspicuous in that
apparently divided into segments of
a and very dark unfarinaceous epider-
And herein, as no botanist, but a mere
ener, I risk the mockery of the initiated
alking about things of which I am
ant; yet mayhap the description will
y something to those who are in the
predicament. And the Rhododendrons
quite wonderful this year. Never have
n so many flowers on the big Aucklandii
re must be over 200, though I have not
to count them. And this afternoon, toil-
p to plant a Rhododendron at the top
e wood, I was amazed at the sight
. cinnabarinum x Keysii covered with
w and red flowers to such an extent that
leaves were hardly visible. The in-
ual bells are rather like those of Keysii,
good deal larger and more open at the
h. And what a lovely flower is Souliei
wense; wide open after the fashion
uliei, some 3 inches across, 11 to a big
led truss, and of the most delicate blush,
r deeper in bud. Would that I knew
has happened to the other plants of it—
n one of the woods, probably, and I
have a look for them; that is, if time
its, which it probably will not. It is
f the flowers which are entirely satisfy-
n the hand as well as on the bush, for it
one of the coarseness or appearance of
nce, which to some of us, at any rate,
s the charm of many of the most
us hybrids. As usual, R. Countess of
lington was frosted in bud here and has
ew flowers, but Lady Alice Fitzwilliam
gnificent, and one or two of the Edge-
hii are good. The majority of these,
almost all the bullatums, suffer from
rowding and drought, and should be
d. One Dalhousiæ is flowering, but
Scottianum, megacalyx, ciliicalyx, or
nubium, and it looks as if these were
r softer than the first named.

R. carneum, too, has failed, as it usually does, even on a south wall, but R. Lyi is very fine indeed and is quite the hardiest of that phylum.

One of the Californian Irises is flowering again, which is pleasant, for two years ago I divided it, perhaps at the wrong time, and it resented the process. Which it is I am not certain. Probably I. Purdyi, but it may be bracteata. Anyhow, it is a pretty flower, pale cream in colour, with numerous crimson lines on a yellowish ground, becoming paler as they extend from the centre.

Iris tuberosa, "The Mourning Widow," flowered earlier and is now showing its remarkable seed pods, which bend downwards from the stem in a manner quite peculiar to itself. Lastly, there is a little Iris which came to me from a friend as Iris Verna. Of this name I can find no record, but imagine that it may possibly be I. lacustris. It was in a pot in one of the cold frames, and noticing that it meant to flower I removed it to the greenhouse to avoid the slugs. Mercifully I looked in the hole at the bottom of the pot and there found a large one ensconced ready to begin operations as soon as the flower showed beyond its sheath.

The little-known Iris verna

Flowers clear lavender blue, with deep orange-yellow splash at the haft. Height 4 inches

It is a charming little plant, 3 inches to 4 inches high, and lavender-blue, with a broad streak of orange-yellow on the falls; and I am tempted to plant it out, but am very doubtful how it will stand the onslaught of the West Country slug, which, delighting in the damp climate, is quite super-voracious.

PETER THE HERMIT.

Herbaceous Phloxes

In the family of hardy herbaceous subjects there are few more beautiful for early autumn blooming in a garden than the Phloxes, but to have the best from them one must be prepared to give them a deep, rich soil, with plenty of room for development. In so far as position is concerned, we should suggest a sunny one, but it does not follow that these plants will not do well grown on a partially shaded border. It is when they are planted in a shallow, impoverished soil, with little or no shade, that failures occur. Whilst the early blooming Phloxes belonging to the Suffruticosa group, which yield their blossoms in summer, are very charming, by far the most popular section is the Decussata, which flower and light up the borders in autumn. Phloxes deserve a word of praise for the town and suburban gardener, as in them he will find repayment for his trouble, and if at the outset he will provide the clumps with congenial soil made up of loam and rotted leaves or old manure, he may count on his garden being gay in September. Planting may be done in late autumn, weather permitting, or in spring, and it is advisable to give them 3 feet or so apart. Personally, I prefer autumn planting if it can be arranged, as one gains time by their becoming established, and so a better chance of their blooming the first season; especially if a dry summer follows.

As intimated, Phloxes increase rapidly, and every two years it is well to examine them as to their need for division. The common method is to increase their numbers by dividing the roots, but if this is not carefully done, shoots are likely to be cut through or damaged. Another method is by propagation from cuttings, and though this does not commend itself to many, as involving more trouble, it is a plan which should not be lost sight of, as plants from cuttings often make the best clumps. Cuttings can be taken in July and August from the base of the plants; these should be inserted in pots of sand and loam and kept in a cold frame shaded from bright sun until rooting takes place. There is a wonderful diversity of colour in modern Phloxes, a great improvement on some of the early variety, both in the size of the individual flowers and their tints. The following are a few suitable varieties: W. W. Jacobs, bright carmine; Mrs. A. A. Smith, deep mauve with purple centre; Miss Mary Radford, delicate pink; Aldenham Pride, magenta; F. A. Buchner, pure white; La Vague, lilac, centre cherry red; G. A. Strohlein, scarlet-orange; Summer Cloud, pale flesh; Mrs. Rutgers, rosy lilac. W. F.

REMINDERS FOR THE WEEK

Southern and Midland

Vineries without fire heat

Excellent Black Hamburgh Grapes may be grown in unheated houses, especially when the borders are inside, and I have matured very nice bunches of the white Foster's Seedling under the same conditions. To carry this out successfully, however, airing, syringing, and watering must be thoroughly understood, and, given this, success is almost certain. Air must be gradually admitted when the temperature has reached 70 degs. in the morning, gradually increasing with the heat of the day until all the ventilators are fully open, the floors having been damped down early each morning when the day promises to be sunny. Early closing is essential, and this, on warm days, may take place from 4 p.m. to 4.30 p.m., the whole of the Vines, woodwork, and floors being syringed down, following which the temperature may rise to 80 degs. or 90 degs. without the slightest harm. Under these conditions growth will be clean and vigorous, and this treatment may be continued until colouring commences, when a little air should be left on all night.

Malmaison Carnations

These are not grown to the same extent as they were before the advent of perpetual-flowering kinds, although we find them still represented in many good gardens. The earliest of them will now be passing out of bloom, and a survey of these must be made, selecting the cleanest and healthiest of those growing in 5-inch and 6-inch pots for potting on into larger sizes. All such should be stood out on a cool bed of ashes (preferably in a cold frame with the lights off) for a fortnight to become hard, potting being taken in hand a little later. Select with the same care those it is intended to layer and treat likewise, syringing them overhead in the evening following hot, sunny days, as this will check Red Spider.

Chrysanthemums

Whether these are being grown to produce a few large blooms or large bush plants they should now be stood out in lines on a bottom of coal ashes, where watering may be carefully attended to and the plants syringed daily, in the cool of the evening for preference. Tying in of the shoots will be constant from this date.

Water Lilies and other aquatics

Do not permit weeds to get the upper hand or cleaning will be a difficult matter. Where the many pond weeds cannot be removed by hand I find a sharp hook similar to a swap hook with a long handle, and in larger and deeper water a scythe, very satisfactory for cutting through the weeds, as this enables one to cut them down close to the bed of lake or pond. Such weeds will then drift to the sides and may be collected by a punt and removed. A certain amount of hand-pulling must, however, be done near the water's edge to keep, not only weeds, but some of the more rampant plants within reasonable bounds.

Staking herbaceous flowers

This important task is best when accomplished early, and calls for a little taste on the part of those engaged upon it. The aim must always be unseen support, the stakes being there, but enveloped in the foliage. This is sometimes a little difficult, but much can be done with the right material and the right method of using it. I know of nothing better than simple Hazel or other sprays, whether for Pinks, Carnations, Campanulas, Poppies, or Delphiniums. On sandy soils constant watering will be necessary for the welfare of herbaceous flowers, Roses, Clematis, and the great variety of smaller subjects which adorn the ground between them, especially Violas, and where water is scarce a light mulch of Cocoa fibre will not only look well, but prove a boon to the plants.

Apples

Where caterpillar is troublesome continue to spray with one of the well-known washes advertised for this purpose, and if scab is frequent I recommend Orchard Spray Fluid. Keep the growths stopped at five eyes from their base on trained trees and keep the latter well supplied with water.

Peas

It is now too late to sow maincrop varieties, and where constant supplies are necessary the early varieties must again be resorted to, such as The Pilot, Primo, Peter Pan, etc., which will not fail to mature a nice crop in late autumn.

Sweet Corn, Celery, Leeks in trenches, and Scarlet Runner Beans

These are all growing freely, but must not be permitted to suffer from lack of moisture at any time, and dewings overhead will assist them considerably. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Grape thinning

Continue this tedious but necessary job as opportunity offers. Full advantage should be taken of dull days to push it on, as twice the speed can be attained during the comparative coolness of a sunless day. It is always best to thin Grapes while the berries are small, even if one has later on to remove an odd berry where there is crowding.

Melons

When the fruits have attained to full size water must not be given too lavishly or the flavour may be injuriously affected. At the same time anything like dryness either at the roots or in the atmosphere of the house or pit must be strictly guarded against until just close on ripening, or a serious attack of vermin is almost certain.

Tomatoes

The feeding of these must have attention, but must not be given indiscriminately or harm rather than good will result. Plants growing in boxes or pots can be kept going nicely by top-dressing with fresh, rich soil augmented by a moderate dressing of some good artificial fertiliser like Thomson's Vine and Plant Manure. Given occasionally in small dressings very fine results will follow, but a heavy dose followed by a copious watering will cause many of the fruits to crack.

Latest Peaches

After these have "stoned" thin out the fruits where necessary, doing this gradually so as not to cause an undue check. The soil must never be permitted to get dry, nor should syringing of the foliage be neglected if the trees are to escape the attention of Red Spider and Thrip. Tie in the young shoots as becomes necessary.

Fruit trees on walls

In a dry season like the present one vermin very quickly become troublesome, especially in the case of Peaches, Plums, and Cherries. The moment the pests appear get the syringe or garden engine at work. Vigorous syringing with clean water is very useful, the enemy has gained a footing som proved insecticide must be brought int It is very good practice to mulch all ov roots of Peaches with farmyard man even half-rotted leaves. This greatl serves moisture in the soil and also the roots nice and cool.

Asparagus

Stop cutting this in good time c crowns for next season will be weal A further dressing of salt, while bein beneficial to the plants, also kills verm weeds, and is, indeed, almost a necess Asparagus beds.

Late Potatoes

The more the soil between rows of toes is worked the better is likely to crop. This, of course, applies only t as are not yet earthed up. If the soil stiff nature use a digging-fork at inte because the Dutch hoe, valuable as does not loosen the soil deeply enough Potatoes. Do not unduly delay the ear up, and see that this is carried out whi soil is nice and moist, for to draw up of dry soil is to preclude the possibil rain ever really moistening such soil.

Sow more Dwarf Beans

The principal batch of this vegetabl now be sown on rich, well-cultivated g in an open, sunny position. It is a goo to sow about three approved varieties time, making the old Canadian Wond of them, this variety being still one very best croppers and entirely relia every way.

Turnips

Small sowings every few weeks nice, tender, and well-flavoured bulbs i of the large, bitter, and coarse spec that one must be content with shoul large sowing be made to serve throu the whole season. Although it is g late, if sown at once the Swede varietie succeed all right, even if the bulbs ar quite so large as those from earlier sow

Maincrop Leeks

As soon as ever the plants are large e have them transferred to their perm positions. Very rich, well-tilled groun necessity if really good produce is de The old Scotch Musselburgh is probab best all-round variety for general use, of decent size and good flavour, whi other will stand the winter better.

Spring Broccoli

It will be well to plant out these they get too big. The ground must n made rich or the plants will be too sof flabby to stand the winter. Excellent r are had by planting on the site re vacated by Leeks, the ground being n cleaned and levelled, and not dug. It of course, be somewhat difficult to ge dibber thrust into the ground, but i work is carried out immediately after rain it is comparatively easy to manage.

Thin crops in good time

All vegetable crops, such as Beet, Let Turnip, etc., should be carefully thinne mediately the little plants are fit to ha If the work can be carried out d showery weather not only will it be easier done, but the crop will in every be of better quality. Beetroot and Le transplant quite readily, but Turnips the exception of Swedes), Carrots, Pars Radishes, etc., will not respond to process. C. BLA

Preston House Gardens, Linlithgow.

Sussex County Show

IE Sussex Agricultural Show was held t Preston Park, Brighton, on June 12th nd 13th. The Horticultural Section was rerfully well represented, including a tn for forestry, where there were de- rtrations to be seen of hurdle making, te making, baskets, lobster pots, and o. The floral exhibits filled three large t and contained perhaps the finest display f summer flowers ever seen in Brighton e district, and in the majority of cases r arranged with the greatest skill and

attendance broke all previous records t long history of the county shows, and ig the two days in which it was held, 122,000 people passed through the turn- the increase in the number of visitors r, no doubt, helped by the greatly im- d means of travel, both by rail and yet there was no overcrowding and the ng was well managed in the capable s of Mr. Morley.

e Barnham Nurseries Company con- bed a large group of Alpines, arranged as gh growing amongst rocks. The Edel- i, Daphne Cneorum, Erinus alpinus, m lydium, Primula Sikkimensis were ell shown and admired. The group was ded the Silver Medal. Messrs. Allwood d a fine exhibit of their well-known Per- l Carnations, the large Malmaisons, a charming group of their Allwoodii, the stinted Freda being a double variety, ara, a scarlet, and Pat, a light ver- ln, being double also. Another group a formed of the Border Carnations, onea, Mrs. G. D. Murray, and Border ow being amongst the best; the last d had flowers of perfect form. Another y group was made up of the new race lpines, shown as though growing ngst rocks. Titana, a wonderful carmine, dy, a puce rose, and Oberon, a beauti- i frilled pink, were particularly pleasing. ers. J. Cheal and Sons showed a beautiful p of herbaceous and Alpine flowers. ngst the former were some superb ns. Apricot, Chocolate Soldier, Roseus, Ruby King, a deep mauve, were amongst est. There were also some fine Geums Pyrethrums. Messrs. J. Cheal and Sons e also showing a small garden with cen- a fountain pool in the open, for which e were awarded a Gold Medal. The e of the tent was filled by a magnificent p of vegetables from Lord Leconfield (re- i scent of Mr. Edwin Becket at his best). h were grown at Petworth by Mr. ter. Messrs. Lowe and Gibson had a superb group of Flag Irises. Hilda, a white with picotee edge and almost white fall; Rhoda, a soft lilac; Afterglow, a light bronze pink; Susan Bliss, a fine pink; Dimity, with white falls and soft pale mauve standards; Crusader, a deep rich mauve; the incomparable yellow pallida Shekinah, Marsh Marigold, much like Iris King but far richer in colour, especially in the standards; Eldorado, a fine copper, were amongst the most striking in a grand collection. Messrs. Sutton Brothers were showing a fine group of Orchids. A very fine plant of Dendrobium Dalhousianum formed a striking centre to the group. Thunia Marshallianum, the rich orange B.-L. Cattleya Rowena; Dendrobium Chrysosticum; the Snake Orchid, Pholidota imbricata; and Brassia varicosa, the grasshopper Orchid, were all very striking. There were also some superb Brasso Cattleyas.

Alton Towers, Uttoxeter, Staffordshire

The magnificent grounds, rose garden, and beautiful lakes are open daily

Mr. W. Wells, Junior, contributed a superb collection of herbaceous plants. Oriental Poppies, Lupins, and Pyrethrums made a blaze of colour. The Lupin, Princess Elizabeth, is certainly the purest and finest deep rose coloured variety yet raised. The exhibit won the Gold Medal. Messrs. Toogood and Sons also had a fine group of Lupins, and beneath them were good vases of Sweet Peas and Dutch Irises. Seen against a background of black velvet the whole exhibit had a fine effect.

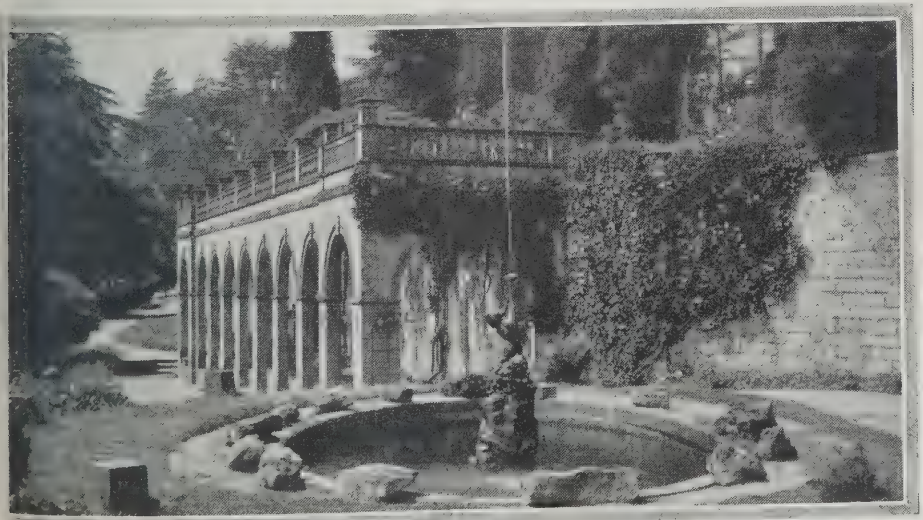
Amongst the competitive groups in the next tent Mr. W. Dadswell, of Uckfield, took first prize for a finely grown collection of Sweet Peas. The whole end of the tent was taken up by a wonderful group of herbaceous plants, for which Mr. Frank Woollard, of Lewes Road, Brighton, was awarded the Gold Medal. In this group there were no less than 40 varieties of Pyrethrums. The whole exhibit was edged with Violas and Pansies.

The centre of the tent was decorated with a non-competitive group of foliage plants and Palms, with a central mound of white Lilies, by Messrs. W. Balchin, of Brighton and Hove. The Premier Seed Company, of Brighton, put up a good non-competitive exhibit of vegetables.

The Southern end of the tent was occupied by a group of finely grown Hydrangeas, white Lilies, and Pelargoniums, seen against a background of Palms. The exhibit reflected the greatest credit on Messrs. W. Miles and Co., of Hove, who were awarded the Gold Medal. The centre of the third marquee was taken up by a great group of florists' flowers by Mr. H. Anscombe, of Brighton. The effect would have been far better had more attention been given to the arrangement of colours. Pelargonium King of Denmark, seen next to bright orange Marigolds, and scarlet and pink Pelargoniums, in close proximity with pink Roses in the centre, and a border of blue Nemesia against magenta Petunias certainly left much to be desired, though the flowers themselves were superbly grown and deserved a better setting. The Chez-Nous Nurseries had a rock-surrounded pool, but the plants placed round it were of various characters and seem to have got into the wrong picture. They were awarded a Silver Medal, but the plants could not possibly have been grown as placed.

Mr. W. G. Bright, of Hove, arranged a beautiful group of greenhouse plants, flowers, and foliage in very good taste. There were some very fine Metrosideros floribunda rising from slender foliage and large-leaved Begonias in the exhibit. A Gold Medal was awarded to Mr. H. Hemsley for Alpines well arranged amongst weather-worn grey limestone on the bench, and he showed another group composed of the newest Lupins. Miss Winifred Walker received the Gold Medal for a selection of her water-colour drawings of flowers.

In the fruit and vegetable section Mr. Harry West, of Worthing, took first prize for Cucumbers; Mr. James Brehoup, of Worthing, first for French Beans; and



Alton Towers: Roman Bath and Loggia

Messrs. Dutton Brothers, of Worthing, first for vegetable Marrows. Mr. A. V. Stewart was awarded first prize for three (shallow) baskets of black Grapes. Mushrooms and Tomatoes were also well shown.

There were very few examples of table decoration shown, but the first prize was awarded to a very charming one in which flesh-coloured and pale cream Tea Roses were arranged with deep red Japanese Maple by Mrs. A. M. Swann, of Warninglid, Sussex.

FRUIT GARDEN

The Morello Cherry

THIS valuable late Cherry is, perhaps, more cultivated than any other variety. It may be grown in three different ways, all of which prove successful. For furnishing a north wall few other fruits are so well adapted. I have noticed certain varieties of Plums, Pears, and Apricots are recommended for this position by certain growers, but according to my experience there has been no permanent success with them on a north wall. The Morello Cherry will also succeed in any description of soil. I have had only one instance of its failing, and this was when a tree was planted in clayey loam with a heavy clay subsoil. Afterwards, however, it was found defective drainage was the cause of this. It is, therefore, necessary that the drainage be effective, more especially as a border under a north wall receives very little, if any, sun.

Wall-trained Morello Cherries require rather different treatment as regards pruning and training from that accorded to other fruit trees. All their fruit is produced from the young wood of the previous year, and a little management is required to cover the wall in a regular way with bearing wood, especially when the trees become old. Lay in the young wood rather more thickly than is usual with other sorts of Cherries, but at the same time do not crowd the shoots too closely together.

Unfortunately, all Cherries are liable to attacks of Black Aphis on the young growing shoots, and as it causes the leaves to curl it is very difficult to dislodge it. Keep a careful watch for its appearance, and before the leaves curl, syringe the trees with force with water in which soft-soap has been dissolved. In cases where the pest has become firmly established the only way to get rid of it is to take the shoot in one hand and brush the leaves over with a brush which has been dipped in the soft-soap solution. I still find the old Gishurst Compound (3 ozs. to the gallon of water) the most effective remedy.

Pyramid trees of the Morello Cherry, when worked on the Mahaleb stock, bear very abundantly, and I have found trees trained in this way are not so liable to attacks of insect pests as wall trees. In the early stages the treatment of pyramid trees, say, up to about six years from the bud, is very simple, merely training the tree to a central leader and pinching the young growing shoots twice in the season. But here comes in a little management as the trees are apt to become too crowded with wood, excluding light and air from the centre of the trees. In all such cases thinning of the branches is necessary. After about six years old it will be found unnecessary to pinch the young shoots. If it has been properly trained, when it reaches this age a very little attention as to thinning and regulating the shoots will be required. When the fruit commences to ripen it is most necessary to net the trees, or the birds will soon strip the trees of the fruit.

The espalier form is another convenient form of growing this fruit. For this I used iron hurdles, and with the aid of sticks trained the shoots along them. The trees bear good crops nearly every year. Summer treatment consists in allowing the trees to grow much in their own way, and in autumn or winter removing some of the old wood and tying in the young bearing wood in its place.

F. H.

Raspberries

Of all the berries the Raspberry is one of the most delicious and useful. Provided they are planted in deep and well prepared soil and proper attention is given to them, both in summer and winter, they will succeed in the same position as long as any other crop.

From Gardening Illustrated

Fifty Years Ago

Aquaria

THERE are several ponds upon Mitcham Common abounding in animal life suitable for the aquarium. In one adjacent to the railway station, beetles, larvæ of the dragonfly, newts, and water snails are to be found. In another pond on the road to Croydon the screech beetles can be seen on sunshiny days whirling around quite merrily. The ditches contain frogs of all sizes, and Willow Moss can be gathered from the stream at the end of Beddington Lane. Keep your weeds, etc., in a small waterproof bag; it will be found more convenient than a bottle. A glass bottle is more useful when collecting animalculæ. Sunshiny days are preferable for collecting aquatic insects, as they come up to the surface. Beetles can be caught in a small net. The easiest way to collect them is to drag out the weeds, and when the large beetles can be seen swimming about in the water a quick movement of the net should secure your quarry.

How to save Strawberry seed

Procure some good blotting-paper, on which mash your berries. The juice will be absorbed and the pulp and seeds will remain on the surface of the paper. Place the latter in a dry, sunny place, and in 10 or 12 days your seeds will be perfectly dry and ripe. Then sow them very shallow in a nicely prepared bed which must be kept moist. In from two to four weeks your plants will be up, when, as soon as large enough, they can be transplanted.—June 21st, 1879.

Many years ago, when I was in Hertfordshire, I remember a garden where there was a bed of Raspberries that was known to be over 40 years old, and better crops of fruit I have never seen. In summer a forest of young shoots clustered around the stools and these were thinned out when 6 inches high, instead of being left, as they so often are, to form a dense thicket to be thinned out in winter. The ground between the rows was lightly picked over with the fork, and manure and a slight sprinkling of soil were spread on the surface annually. These old stocks responded wonderfully to this treatment, producing stout canes 6 feet in length.

But though Raspberries receivin
cultural attention may occupy the
profitably for many years, I still con
prudent in making a new plantation t
ground that has been occupied wit
other crop. It is by allowing the
growths to be greatly crowded duri
summer and damaging the roots b
digging during the winter that mal
ground what some growers term "
berry Sick." The Raspberries, howev
not sick of the ground, but of the un
treatment to which they are subjected

Turnips for winter

time has now arrived to make pre-
ions for the winter crops, and it is de-
e that the ground should be in a
ughly fertile state. Manure in its rotten
holds moisture, and this is what is
d to assist in seed germination and also
pporting the young plants. A dressing
e would be an advantage to old gar-
rich in humus through years of manur-
Burned refuse is also an assistance, but
this well into the surface, not scatter-
along the drills. Salt is also a capital
lant for Turnips. Not much is re-
l, just a mere sprinkling, it being
d to the surface before the latter is
n down. For early winter use Snow-
s a good Turnip. Red Globe is valu-
or succession and keeps well, but for
se the Orange Jelly and Chirk Castle
stone are invaluable; 15 inches apart is
enough for the rows of the latter and
ball, allowing an extra 3 inches for Red
on account of its larger leafage. Be-
ven the young seedlings appear dust
urface over with soot every morning,
is if the weather should be dry, as a
uard against Fly. If one sowing fails,
up quickly with another. Timely hoe-
nd also thinning must be strictly
led to before the seedlings become
led.

Late Peas

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

ROSES

Pruning climbing Rose in cool house

I should be much obliged if you would tell me how far, and when, Roses should be cut back. I planted Climbing Lady Hillingdon, Gen. McArthur, etc., in November and cut them back the next spring to about 2 feet. They have made rampant growth this spring, but had very little bloom. E. C. H.

[Seeing your plants are growing so vigorously do not prune much at them, but just cut away all the weaker shoots and train in the strong growths, taking care not to overcrowd these. You can remove the soft points and the plants will send out fresh side shoots and bloom again later on if you keep them clear of vermin. Give abundance of air day and night, but try to avoid draughts. Syringe the trees well in the evenings of fine days. The trees can be pruned again in spring just when growth is starting, when some of the older branches can be removed if there are sufficient strong young growths to take their place.]

Roses withering

(" Beginner ").—Your Roses are certainly in a very poor state. As the season has been so dry throughout, it seems rather as if drought had something to do with the trouble. Copious drenchings of clean water might, therefore, help, and will quickly show whether or not that dryness at the roots has caused the bushes to behave in this way. It is also possible, of course, that the " horse litter " may have come in contact with the roots—a thing to be avoided. Manure for Roses should be well rotted before being used, and even when in this state none of it must come near the roots at planting time. If the bushes refuse to grow away strongly this summer you had best procure fresh, healthy plants in November.

GREENHOUSE

Conservatory

(" Torbay ").—If you mean that the centre bed of your conservatory is planted with Roses and Lily of the Valley we would be inclined to clear the whole of these away, for there is great difficulty in successfully cultivating Roses under glass when not in pots, especially by a novice. By clearing these out and having a stage in place you could have a succession of flowering plants that would keep the house gay most of the year. These to include Hyacinths, Daffodils, Tulips, Primulas, Cinerarias, Calceolarias, Schizanthus, Pelargoniums, Chrysanthemums, and many others. In a house of the size named a pond would hardly be suitable, as it would have to be quite small if room was to be left for plants of various kinds. The Palms may be set on the floor or on a stage as desired.

FLOWER GARDEN

Phlox not blooming

(M. M.).—We think that the main reason for your Phlox subulata not blooming is that your soil is too rich. This plant blooms best when planted in rather poor, sandy soil in a sunny position. Much the same applies to the Cerastium.

Border Carnations

(Mrs. A.).—We have carefully examined the specimens sent, and can find no trace of wireworms, maggots, or other vermin to account for the Carnation plants going off in the way they are doing. Ground, of course, gets "Carnation sick," so if you have been growing your plants on the same site for more than two years, that in itself would explain the matter. Drought is also a rather likely cause in a dry season like the present.

What to sow

May I ask your advice as to what to sow now to get plants for spring bedding with Tulips? I would like my beds to be filled with Tulips and bedded beneath with plants to give best effect. Please suggest suitable colours of Darwins or May-flowering Tulips and carpeting plants—that is, Wallflowers, Myosotis, etc.; anything to give a good effect and blend in colour. I have large patches in herbaceous border to fill in next year. Also would it be suitable to fill in the patches with Wallflowers, etc., and plant Tulips between? WEST SOMERSET TULIP.

[There are not a great number of plants suitable for your purpose that you can sow so late in the season. Wallflowers and Myosotis ought to have been sown a month ago to give them time to attain a decent size, while Polyanthuses, Saxifrages, Violas, Daisies, etc., should have been raised the previous year so that you could be certain as to the colours, most of these not coming absolutely true from seed. You might manage the Myosotis yet by sowing in a box and setting this in a frame. This makes a good carpet for most Tulips; at least, for crimson, pink, pale yellow, and white. Clara Butt Tulip is fine with yellow Wallflowers, while a carpet of white Mossy Saxifrage may be dotted with any coloured Tulip. Blood-red or Vulcan Wallflowers may be dotted with Inglescombe yellow Tulip, while Primrose Monarch Wallflower makes a fine carpet for Inglescombe Pink Tulip.]

TREES AND SHRUBS

Pruning Pyrus japonica

(F. K. W., Surrey).—Although Pyrus (Cydonia) japonica will flower on young shoots, so, too, will many varieties of Apple and Pear, so the pruning of the former is practically the same as that meted out to the others. The young growths are shortened back in late summer and then further cut back in winter, and will then produce abundance of flower-buds on short spurs. When grown in the open less pruning is required.

Rhododendrons from cuttings

(G. H. S.).—While with care Rhododendrons can be raised from cuttings, this method is seldom satisfactory, and is, therefore, seldom resorted to. If you still think of trying it, the best time is when the base of the young shoot has become fairly firm. Insert in silver sand and set in a frame.

Pyrus japonica not flowering

(M. M. R.).—It would seem that you over-manure your Pyrus japonica, thus sending it all to growth instead of flower. Under these conditions, pruning can have little effect. Under ordinary treatment, which includes shortening the current season's shoots in August, and in winter further reducing the length of these, this plant blooms profusely every year. We would suggest the withholding of all manure and the pruning of the trees as above suggested, allowing, however, the trees to extend their size, providing there is space for them to do so; that is to say, all the leading shoots should be left and trained to the wall, merely snipping off the soft points to induce the formation of side shoots.

Carpenteria californica

AM I right in supposing that the enclosed lovely flower is Carpenteria californica? —[Yes.—Ed.] It is a low-growing shrub, growing in a south aspect bed, and when we came here two years ago was almost smothered by a Jasmine and only had one flower last year. This year it is flowering finely and is beautiful.

Mrs. E. Robinson.

Clevedon, Somerset.

[This very fine shrub may be effectively used out-of-doors in favoured districts. Some years ago I saw some very fine examples in the Thames Valley, not very far from London. These were beginning to expand their blossoms at the time of my visit—during the last week in June—and I was assured that the plants were there quite hardy. In our northern and somewhat fickle climate, with its late frosts, it is, perhaps, better to use C. californica as a greenhouse shrub. It is well adapted for planting on the wall of a greenhouse or in an unheated corridor, where it will flower freely early in April. The blooms are pure white, approximately 3 inches across, each having a bold group of yellow stamens. The foliage, too, is attractive, and the shrub succeeds to perfection in a rather sandy loam, which must be well drained. A most desirable shrub.—W. McG.]

Magnolia-like tree in China

As a new reader of Gardening Illustrated, I venture to ask if you can assist me in identifying an Evergreen tree that grows in China, bearing cream coloured Pear-shaped buds, strongly scented like "pear-drops," of a waxy texture like a Magnolia. The leaves are of a shiny dark green, similar to those of a Magnolia grandiflora. Both flowers and leaves are about 2 inches long, the buds, before they show colour, are enclosed in a velvety sheath, again similar to the Magnolia. I am anxious to procure a specimen of this, but do not know to whom to apply.

G. V. L.

Essex.

[The plant which you describe is probably Michelia fuscata syn. "Magnolia fuscata." It is fairly hardy in sheltered districts of the West Coast, but is best grown in a cool greenhouse. If planted in the border against a wall or pillar it makes a fine bush about 10 feet high and is free flowering. It is also amenable to pot culture, and under this system its deliciously scented flowers are borne on quite small plants. Plants may be obtained from Messrs. R. Veitch & Sons, Exeter, or any nursery specialising in the more tender Magnolias.]

FRUIT

Silver Leaf

(F. K. W., Surrey).—"Silver Leaf" is one of the notifiable diseases, so you should advise your local authority or the Ministry of Agriculture of the fact of its being present in your garden. While we do not think there is very much fear of a healthy Apple or Pear tree being infected, we could not say that there is no danger. However, if you burn every scrap of the Plum and spray the wall with a strong fungicide it might be worth the small risk. We can hardly see how the Larch pole could be responsible for the infection unless it had been in contact with a diseased Plum, Peach, or other tree subject to this trouble.

Carpenteria californica

Sulphur and Vines

(W. J. E.).—If you are merely dusting a little sulphur on the foliage it will do no harm, but if placed on hot-water pipes considerable damage is likely.

Almond tree fruiting

(Miss F. B. Smith).—It is rather unusual for the Almond to fruit in the British Isles, not because of its not being hardy, but mainly because the flowers open so early in the year, that these are almost always prevented by frost or cold winds from setting. In a few of the more favoured districts they have a better chance, as seems the case with your tree this year.

Budding Cherries and Plums

(M. McClintock).—(1) Yes, buds from the current season's wood should be selected, preferably near the middle of the shoot, and these are inserted not far from the ground. It would be impossible, with the space at command, to give full details of how to bud fruit trees, but if you know how Roses are budded, proceed in exactly the same way, the best time being in August. (2) It would probably be better to graft these large,
growing trees rather than bud them, a
it would not be impossible to carry
latter. (3) We would not advise the
from the neglected Plum trees bei
as stocks without their being prope
pared. To do so as they are wou
result in a great number of other
springing up all round them, while t
or grafts would have a poor chance
ceed. Cherries and Plums are fr
grafted, but budding nowadays i
favoured.

VEGETABLES

Mint

("East Berks").—The Mint gro
boggy ground can be quite safely u
cooking purposes.

Seakale

(C. M. T.).—There is no possible
which Seakale can be produced in
short time. Probably the fastest wa
means of root cuttings secured in Ma
inserted in pots of light soil and s
greenhouse, these being later on plan
in rich soil, but even by this method
a year must elapse before the roots
for forcing. Seed sown in April n
good management, produce forcin
within two years.

MISCELLANEOUS

struction of the jelly-like substance you mention, see our reply to M. A. Young in this issue, and for the slugs and sticklebacks, we recommend you use a few drops of a mixture of three parts of colza to one of paraffin, which should be either sprayed or dropped into the water and encouraged to spread over the surface. If you do not mind losing the fish, a little lime would prove beneficial.

Pruning

(C. M. T.).—(1) Yes, prune Jasminum primulinum after flowering. (2) The Syringa (Philadelphus) should only have worn-out wood removed and an odd shoot here and there should there be overcrowding. Much the same treatment suits the Weigela.

Strawson sprayer

(R. Angell).—The address you want is the Strawson Chemical Co., Ltd., 79, Queen Victoria Street, E.C. 4. Your best plan would be to get the sprayer overhauled locally, and the firm doing the job would write to the above firm to obtain any new part that is required. You do not state the age of the sprayer. If it is a very old pattern it may be best to scrap it altogether. However, let someone have a look at it who knows something about spraying machines and they should be able to advise you. If the machine is fairly recent the cost of putting it right should not be excessive. Please note that we do not reply to inquiries through the post.

Voles

(Worried).—You do not state which vole is causing you trouble. This is important because the bank vole, Evotomys glareolus, is trapped very easily by means of a box mouse-trap, but the short-tailed field vole, Microtis agrestis, is shy of traps and is rarely caught. The natural enemies of the vole should be encouraged, and of these perhaps the most important is the owl. Kites, hawks, jays, magpies, weasels, stoats, and even the despised cat are useful in keeping down voles. If your pest is the short-tailed vole, the only traps likely to be successful are: (1) Vessels narrow at the top, wide at the base, should be buried in the soil, the top of the vessel should be well greased; the voles will fall into the vessel and can then be destroyed. (2) Holes dug fairly deep, wide at base and narrow at top, will trap voles.

NAMES OF PLANTS

T. L.—Muscari comosum plumosum syn. monstrosum (the Feather Hyacinth).

R. B. Carter.—1, Greater Stitchwort (Stellaria holostea); 2, Veronica verna; 3, not recognised (this was completely withered up).

R. L.—Calceolaria scabiosæfolia.

S. Wales.—The Passion Flower (Passiflora cœrulea).

H. Windsor.—1, Æthionema Warley Hybrid; 2, Veronica gentianoides.

M. Neilson.—1, Ilex Aquifolium; 2, Aucuba japonica maculata.

A. S. L.—2, Erigeron philadelphicus, a good plant for growing in a wall.

South County Dublin Show

Dun Laoghaire is the leading township in Ireland, and a flower show worthy of this premier position will be held by the Horticultural Society at People's Park, Dun Laoghaire on Wednesday and Thursday, July 31st and August 1st. A very complete and attractive prize list has been prepared, which should appeal to all types of gardeners. The Organising Secretary is Mr. F. H. Meade, Park Lodge, Castlepark Road, Sandycove, Co. Dublin.

LATE REPLIES

Apple caterpillars

(C. B. B.).—From your description and the nature of the damage to the specimens we think the trouble is due to the caterpillar of Winter Moth. Caustic soda wash in winter is useless against this pest, but you will find that a $7\frac{1}{2}$ per cent. solution of a tar-oil wash will give you a fair measure of control. In addition, all your trees should be grease-banded in October to trap the female "Winter Moths" as they ascend the trees to deposit their eggs. Spraying the trees with a solution containing nicotine will kill the caterpillars when young, and one containing lead arsenate will kill the caterpillars at any stage.

Raspberries and Mosaic

(T. Lane).—The specimen Raspberry shoot is affected with Mosaic disease of Raspberry. If the canes are all affected and the disease is affecting the cropping powers of the canes the only control is to take up and burn and replant some new canes in another part of the garden. Some varieties of Raspberries are very prone to Mosaic and should be avoided in districts where the disease is prevalent. Try the variety Lloyd George, as this variety is not very susceptible.

Diseased Iris

(R. F. Skelton).—You do not state what disease has affected your Iris. If it is Soft Rot, lifting and replanting should be successful in dealing with the trouble. Take up the rhizomes and carefully cut away all the soft portions. Steep the sound portions in 2 per cent. formalin solution for several hours; replant in a new situation. The more lime you add to the soil the more likely is Soft Rot to trouble you, because the bacterium responsible flourishes in an alkaline medium. If you burn the diseased material you will get no trouble with flying spores.

Diseased Walnut

(Juglans).—We are incubating the material, and as this process takes a few days before any definite result is obtained we shall be obliged to hold over your reply until an early issue.

Gooseberry Cluster Cup

(M. G. Norris).—Your Gooseberry trouble is the fungus-causing Gooseberry Cluster Cup. To control this you should pick off and burn all diseased wood, leaves, and fruit, afterwards spraying with a fungicide such as lime sulphur or liver of sulphur. Sedges should be destroyed if near the garden, because the winter stage of this disease is passed on these plants.

Crab Apple diseased

(E. Angell).—If you will send us specimens of the Crab Apple branches that are failing we should be pleased to examine them for you and report in due course. From your description it is impossible for us to advise you. Half-a-dozen diseases might cause the trouble, and as the control is different with each disease we would rather wait for the specimens. Pack your specimens in a small tin box.

Diseased Lilies

(H. L. W.).—Your Lilies are affected with a trouble known as "The Lily Disease," which is caused by one of the Botrytis fungi. The disease attacks all the aerial portions of the plant, but the bulb generally remains sound. The spread of the Botrytis is always most rapid during spells of cold north-easterly winds. Any check to the plant will cause a very rapid spread of the trouble. All diseased portions should be cut or pulled
away and burned. This treatme
naturally weaken the bulbs considera
it seems to be the only remedy. In
where this disease is troublesom
should be planted in sheltered p
facing south, and all north-easterly
should be avoided by giving the ne
shelter.

Gladioli Rotting

(W. C. L.).—Your Gladioli are
with a rot which occurs during storag
cause of this rot is at present unknow
should take up and burn all the cor
did not start into growth, together wit
that started but are now weakly.
material should be burned. After lift
healthy corms in the autumn you
take care to store them under good
tions. Before planting in spring all
should be peeled and carefully exa
Those showing any sign of stora
should be destroyed. If this treatm
systematically carried out you shoul
no difficulty in obtaining control.

The Rock Gardens at Llandudno

DENERS who remember the Happy lley at Llandudno only as a bare slope nning down to the sea between two of the Great Orme, made merry by nter of Nigger minstrels, would be tly surprised by the rock gardens that rung up during the last few years and nbrace over half a mile of pathway on pes overlooking one of the most ul bays in Great Britain, sometimes, s blue sea, described as the Naples of rth.

Great Orme has long been the haunt anists, as here, alone in our islands, the rare Cotoneaster vulgaris, while rse-shoe Vetch procepis s a), with its te sheet of flowers, and la calcarea, tle blue Milk- may be found the limestone s, and high the town on cipitous slopes be seen fields alerian (Cen- us ruber), pink ood-red, light- p the grey An interest- gend (legends ways interest- ven if histori- correct) has it ueen Elizabeth uced the red n to Conway and that the ave been scat- in the vicinity wind. Cer- the habitat is and the effect, stance, on the of the railway running through the grounds most vivid.

ugh there is still a very great amount nstruction to undertake in the arrangement of the actual rocks to bring them into with the massive crags of the Great at their back, and although one may t the artificial effect at present obtain- e mass effect in this terraced rock is wonderful, and, thanks to the r, Mr. W. G. Robertson, and a tem- climate, where, except in the last fear- winter, the average maximum frost es 5 degs., the colours are rare and .

t from Aubrietia, Rock Roses, and Catmint (Nepeta mussini), which assumes a brilliant lavender generally unapproachable in our climate, the large splashes of colour are provided by plants seldom enjoyable in masses. Onosma taurica, with its golden drop flowers, becomes a bush overhanging the sunniest ledges; Linum flavum and its hardier brother, L. arboreum, form wide sheets of yellow; Pentstemon azureus, with its purple-blue clouds, gives a most uncommon effect. Dianthus hybridus roseus (an improvement on D. Napoleon III. and D. Emile Pare) and D. hybridus Salmonæ form masses of colour visible far out in the bay like some giant coastguard's flag, and D. multiflorus roseus, with beds of the pink Æthionema Warley Hybrid, lend strength to the illusion. Another mass effect is obtained by the rare china-blue starred annual, Sedum cœruleum, all too seldom offered in seed catalogues, and often all too difficult to raise when obtained, though here, in the Happy Valley, it seeds itself, and, after flowering, becomes a glory in bronze.

Llandudno Bay and the Little Orme from the rock gardens

But the keen gardener will also find plants to interest him, and constant letters are received by the Curator from America and the Continent asking for advice on the plants which are to be found detailed in the handbook issued by the Llandudno Town Improvement Association. In the moraine, among some interesting little plants is to be found Raoulia australis, named in Australia, if the writer remembers rightly, the "sheep plant," and here also it has assumed the proportions of a reclining sheep. Dianthus neglectus grows in foot-wide patches to the envy and annoyance, perhaps, of less successful gardeners, and surrounding the new water garden many Asiatic Primulas are making their appearance.

Despite the limestone, Meconopsis, including M. Bayleyi, M. Prattii, M. integrifolia, and M. simplicifolia, are flowering well, but it is in the spacious pockets throughout the gardens that many find most enjoyment. Here, with pencil and notebook, may be seen gardeners enjoying masses of Asperula Gussonnii, Androsace lanuginosa, Campanula Laurii, Sedum amplexicaule, Cotyledon simplicifolia, Erinacea pungens, Gypsophila cerastoides, and many other glories, while along the lower terraces some 150 species of shrubs have been established to satisfy the increasing interest now taken in this form of gardening.

After 15 hours' sunshine on the June day these notes were pencilled the slopes to the summit of the Great Orme were climbed. Snowdon could be seen in the rays of the setting sun. Snowdon, which mounts guard over the rarest wild flowers of Wales and holds safe in its Devil's Kitchen several true Alpine plants with the beloved Gentiana Pneumonanthe and Wahlenbergia hederacea haunting the marshes at its base, while hidden near the sleeping villages between lay two gardens whose owners are known to every reader of the pages of Gardening Illustrated.

The Happy Valley is a spot for the garden-lover to visit. Its colours form one of those milestones of memory which we recollect as having reached with a cheerful heart.

F. H. Fisher.

The rock gardens at Llandudno
The path up the valley towards the Great Orme

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

A proposed Rock Garden Society

THE suggestion advanced by Sir William Lawrence in your issue of the 22nd inst. is an excellent one, and I trust it will see early fruition.

There is a very sound reason for the increasing popularity of rock gardens. It seems to me that the whole interest and purpose of a garden is to give to its possessor a sense of mental rest by observation and interest in subjects which, apart from, or perhaps because of, their natural beauty, afford a complete mental change and relaxation from the stress of household, social, or business concerns.

Every modern house possesses its garden, but these latter tend to become smaller as costs increase and leisure becomes less. The garden in miniature—a complete rock garden, mountain and forest, stream and plain—can be accomplished in little, in the most limited space imaginable, and a thousand plant subjects are available, among which the mind of the possessor may revel and find repose equally with the owner of broad acres. One may accomplish oceans of enjoyment in the contents of a mere stone sink, while a few square yards of scientifically placed and planted rockwork will afford enjoyment from one year's end to the next.

In addition to other forms of satisfaction the possessors of rock gardens in the area of townships enjoy an almost complete immunity from the depredations of cats.

Undoubtedly rock gardens well merit their increasing popularity and a Society to encourage and develop the interest now taken in them. HERBERT G. LONGFORD.

Abingdon, Berks.

—— The idea of forming a Rock Garden Society is a splendid one. Its appeal would be much wider than that of an Iris or Delphinium Society. There is no subject on which there is more disagreement, but there is room for everlasting happy discussion and initiative in the wide field, which includes flower-lovers, collectors, and lovers of landscape pure and simple. If the principles which appeal to the various temperaments were understandingly discussed and pictured there would be less acrimony, more enjoyment, and much progress.

Merriott, Somerset. HUGH E. SEATON.

Rock gardens at Chelsea

I want to take you to task on the subject of rock gardens. You, together with your contemporaries and the Chelsea Flower Show judges, are blindly misleading public opinion; none of you yet seem able to move out of the Victorian rut. I have suspicions that you all have gardens bedded out with Geraniums and Lobelia, and a rockery in the corner of Ferns and tree-stumps.

Whoever wrote your report of the Chelsea Show must, I am sure, favour this time-honoured style, judging from his views of the rock gardens exhibited there. The object of his admiration was as full of artistic and technical faults as a picture on an expensive chocolate box.

Happily the public are not entirely led away, and there is a volume of opinion demanding something better in rock garden construction than just piles of expensive rock without meaning. There are at present three outstanding exponents of rock garden construction—Gavin Jones, Symons Jeune, and John Wood—and it is to these men we are looking to lift us out of the "ordinaire." They each have a style of their own, and it is hard to say which leads, but it is they, and they alone, who seem able to combine boldness with restraint, and it is they who seem capable of taking stones from the hillside and building them to look like live rocks. It is they, and they alone, who seem able to make a well-balanced picture. Do your judges and reporters ever get at a distance from the exhibits and examine them as pictures? I am sure they do not or they would not fall into such error. Your reporter with
the Victorian leanings would do well t
the work of these men if he wants tc
public opinion in his writing. Let hi
up his collection of Ferns and tree-
and plant Lilies of the Valley to grov
place till enlightenment comes to him.
he can start again with changed idea

Geranium grandiflorum alpin

In discussing Geranium grandiflo
his "English Rock Garden," Far
marks that "It has a specially lovely c
form, G. g. alpinum, from the upper
Turkestan." This is in bloom in m
garden as this is written, in mid-Ju
has been in flower for a week or tv
will continue for some time. It is
desirable plant, much superior to the o
G. grandiflorum, especially for the ro
den. Its dwarfer habit renders it nea
more suitable for the smaller as well
large rock garden, while its large pur
flowers are borne in great numbers.
Turkestan variety is as hardy as the o
one, and, although not equal in refine
such charming Crane's-bills as G. arge
G. Traversii, and others of their class,
a valuable flowering plant much appr
by those who possess it. It is of ve
culture in ordinary loam. S. AR

Meconopsis Baileyi: Its beauty cultivation

Well-grown colonies of this superb
Poppy are a revelation, even to enth
who meet with them for the first tim
ing in numbers and at the height o
beauty. I have before me as I write a
of over 80 handsome plants which are
ing between small Camellia bushes on
moist ground, and beneath the gentl
of a huge Oak tree. Many of the
measure 4 feet 8 inches in height,
many as 30 handsome saucer-like
have been borne from a single plan
of the most wonderful blue and with
tuft of golden stamens.

Light and shade vary the imposing e
these delightful flowers every few m
of the day, their intense colour deepe
otherwise with the passing shadows.

All lovers of gardens owe a debt o
tude to Captain Kingdon Ward for
troduction of this extraordinary Poppy

It is a woodland species, and I
advise all who wish to see this ex
flower at its best to grow it under su
ditions, when its rich, glaucous green
and stems will develop perfect healt
the plants give very little trouble on
are safely planted out. When pla
wind and sun and drier situations, n
do the leaves assume a brown, sc
appearance, but, here at least, the sp
bloom, pretty though they are, will n
comparison with those growing in
shade.

I was first introduced to this fine
and the way to succeed with it, by a
gardener near Horsham, Sussex, wh
sesses a famous woodland garden, an
grows this and other species to perf
and who is at great pains to see t
dowdy purple shades remain long in
pany with those of his best true clea
Rogues, however, will appear among a
of seedlings, and should be marke
mediately if the strain is to be kept pu

The seeds of Meconopsis Baileyi sho
sown in pans of light soil as soon a
and raised in a cool, closed frame,
from bright sunshine, the end of Jun
ing July, or early August being suitabl
for sowing.

When large enough to handle, prick
small pots filled with equal parts o

mind leaf-soil to which a little sand has
dded and continue to grow on in a cold
where they may remain until the
of April of the following year.
y should then be planted out at 18
apart where they are intended to
very little after-care being needed.
deep woodland soil possessing a fair
tion of decayed leaf-mould will suit
admirably, and a fairly moist, but not
nt, position will prove an excellent
by when the plants are developing their
spikes. The partial shade of one of
mmer leafing trees is also most bene-
indeed, I consider such shade indis-
ble to their well-being. Plants should
ly be established in their flowering
rs by the middle of June.

vetye. E. MARKHAM.

he scent of Clematis montana

OUR correspondent's (Mr. A. T.
ohnson) letter in your issue of June
5th on the above delightful plant
ts me to send you the enclosed "snap"
same as growing here.

ill not attempt to compete with his
ng definition of its furtive odour, and
ly say that I have had the same ex-
ces. I do venture to claim, however,
y specimen is fully worthy of its posi-
and where it shows to better advantage
amouflaging an old tree stump.

J. SUTCLIFFE PYMAN.

sebury, Sutton Scotney.

Mr. A. T. Johnson's interesting note
scent of Clematis montana in the June
umber of GARDENING ILLUSTRATED, em-
ses the difficulty of describing smells,
is, therefore, with considerable diffi-
that I venture to suggest that the com-
ns for the scent which he quotes,
y, macaroons, newly baked bread, and
ig toffee, may perhaps have in common
ture of vanilla and bitter Almond.

illa occurs very widely in the vegetable
om, and is often fairly evident in the
of bran and Potato skins, and it is, I
just perceptible in newly baked bread.
croons are flavoured with bitter
nds, and vanilla would come into the
of boiling toffee, if only by association.
ave not had the opportunity of smelling
atis montana this year, but my recollec-
f its scent is that of a mixture of vanilla
a little bitter Almond and a trace of
arine (*i.e.*, of Woodruff or Tonka Bean),
some honey-scented substance, and
ps a dash of Hawthorn. This descrip-
sounds rather complicated, but so, I
, is the scent. The Clematis has, no
, its own good reasons (perhaps not
nected with flies) for suggesting the
sphere of a confectioner's shop; but I
with Mr. Johnson's friends in awarding
re marks for ingenuity than fragrance.

F. A. HAMPTON.

Ixiolirion tataricum

s delightful bulbous plant is deserving
neral cultivation; the blue colouring of
wers is so clear and pure and the plant
easily grown in a sunny border, planted
ep, sandy loam. The grass-like foliage
des a splendid foil to the rich blue
rs, which are borne in profusion on stiff,
stems. Flowering in May and
I. tataricum, sometimes called I.
ii, proffers a welcome supply of good
material for cut purposes, and the de-
ive effect of a colony in the border or
e rock garden is considerable. The
are tolerably hardy, but a little winter
tion is advisable, especially in the colder
cts. The bulbs may be lifted, dried, and
ted in the autumn, but I prefer to allow them to remain undisturbed until congestion, with a risk of its attendant weakness, compels attention. The species hails from Tartary, and although introduced many years ago, it is only during recent years that its undoubted merits have been recognised.

I. montanum is but rarely met with; it is similar to the better known plant, flowering a little later, and with a prominent spike inflorescence, whereas the flowers of I. tataricum are arranged at the top of the scape. I. montanum was introduced from Syria in 1844, and is one of the several plants reputed to be the "Lily of the Field." Seeds and offsets afford ready means of increase for both species. RALPH E. ARNOLD.

Cirencester, Glos.

Colour descriptions

Some kind person, unknown, sent me your number of January 5th, and I promptly became a subscriber, only regretting not having known your excellent paper sooner.

Clematis montana rubens at Norsebury, Sutton Scotney

The letters of Major Chappell and others on colour descriptions is a most interesting field, but there are clearly two groups to be considered. On one side are experts, with spectrums and elaborate colour charts (Ridgeway's, Benary's, or the Répertoire des Couleurs), and on the other are plain people, who, in the midst of planting, with time and weather pressing, hastily turn to their favourite catalogues for a description of colour. It takes time and patience to match a flower to a colour chart. This spring I had a friend who is a fine artist, and two of the best professional horticulturists in Italy, all busy with Iris and Benary's chart, and all agreed it was not very useful as a help to planning for general colour effect in the garden.

Here are some descriptions of Iris according to Ridgeway's chart: 1, "Standards Massicot yellow shading into amber-yellow at base. Falls horizontal; ochre-red in region at end of beard, followed by a central area of bishop's purple, which shades out at once to the margin through light Lobelia violet to pale Lobelia violet. It is a variety admired by some and detested by others." That one can well believe after such a description. 2, "Standards . . . violet-purple shaded to copper at claw, maroon veined. Falls flaring; Cotinga purple with . . . maroon veining; beard yellow. Style branches yellow, centre and crests pale Amparo purple. General effect of flower in mass, rich, dark red of one tone, but a bicolor, due to the heavy velvety falls."

Who would have guessed the effect to be red from the above names? And is it not a confession of inadequacy to have to add on this translation, as it were? I, for one, had to refrain from ordering any Iris from this list in sheer ignorance of what the colour effect of each flower was.

This happens with Tulips, Roses, Asters, Dahlias, and almost every flower. I humbly contend that for everyday work some 25 to 35 colour terms should be used. Everyone knows, more or less, what is meant by primrose-yellow, gentian blue, old rose, emerald green, sky-blue, blood-red, russet-red, lemon-yellow, gold-yellow, coral, and shrimp-pink. Those who grow Roses, Dahlias, and Antirrhinums have found the dressmaker's "tango" describes exactly a certain coral-orange shade.

St. Egwin is to me a pink Aster. So is Lady Lloyd, Namur, and Lutelia. But Barr's Pink is magenta, in the line of Lil Fardel and Edna Mercia.

Souv. de Claudius Pernet is a lemon-yellow Rose, and Golden Emblem is golden.

Isis and Harry Veitch are blood-red Tulips, and the International, Ouida, and Lord Byron are crimson-red. And so forth. Everyone makes their own "colour charts," and are helped by some catalogues which give the general colour effect of a flower.

Villa Senni, Italy. COUNTESS GIULIO.

Verbenas as pot plants

As Mr. Burrell says, on page 415, issue June 15th, the Verbena has gone out of favour as a bedding plant nowadays; but there is one way in which some find it very useful. That is as a pot plant. My own procedure is this: Cuttings are taken in September, put thickly in a 10-inch seed pan, and placed in a cool house during the winter months. Early in the year the young plants are potted off singly into 3-inch pots and given a rise of temperature. With the lengthening day they make rapid progress and are soon ready for transferring into 5-inch pots. At this stage the tips of the growths are pinched occasionally to induce a bushy habit. Finally, and before becoming root bound, they are moved into 7-inch pots, in which they bloom. Pieces carrying from 30 to 40 blooms on neatly staked shoots are most attractive in late April and May in the conservatory; and they are a change from the rather over-done Schizanthus, Clarkia, and so on. The variety Miss Willmott is unrivalled for this purpose, and plants last well in rooms or corridors in the house.

A SCOTTISH GARDENER.

Papaver caucasicum

This fine Poppy seems to be rare in cultivation (but I see that, according to Pritzel, it was figured in the "Botanical Magazine," No. 1,675), and I do not remember its name in catalogues before it was listed, a year or two ago, by Mr. Ingwersen; but it deserves, I think, to be better known. It is handsome, even before it flowers, for it forms a flat rosette of much-divided grey leaves, which looks like a piece of silver filigree work when it is jewelled with dew on a sunny morning.

Olearia semidentata, 6 feet through

Now it is in full bloom and has sent up a great sheaf, some 2½ feet high, of many-branched stems bearing a few grey Dandelion leaves and a multitude of flowers. These are about 2½ inches across, pale pinkish-apricot in colour (it is difficult to describe the shade exactly), and so delicate in texture that they are almost transparent. They have a pleasant and quite powerful scent, like that of ripe Greengages, but rather sweeter.

The plant is monocarpic, but promises to set seed as plentifully as most of its family, and it is quite hardy, for it passed the trial of last winter in the open without injury.

F. A. Hampton.

The Boronias

The note by "F. H.," page 414, issue June 15th, concerning Boronia megastigma, reminds me that this species, by reason of its exquisite fragrance, rather overshadows other members of the family. A very desirable form is B. heterophylla, which is not so difficult to grow satisfactorily as B. megastigma, and if its brightly coloured flowers be not so fragrant as those of the latter they have, nevertheless, a very pleasing perfume. It is necessary to say, however, that the leaves of B. heterophylla ought not to be rubbed or agitated, as they have rather a heavy and, to some people, disagreeable odour. Other useful forms include B. elatior and B. serrulata, both of which flower at a later date than the others. All will thrive under the treatment recommended by "F. H." It may be added that the Boronias appreciate shade when in flower, and these remain fresh and effective for a long time if protected from the direct rays of the sun.

W. McG.

Saxifraga canis dalmatica

Referring to the note by Mr. S. Arnott in your issue of 15th inst., this Saxifrage which originated in my garden here as a self-sown seedling is, in my opinion, a cross between Saxifraga Cotyledon and S. Aizoon balcana, appearing as it did close to these two plants, and bearing as it does some characteristics of each, and until the name "Spotted Dog" was suggested by Mr. Clarence Elliott—and I do not find any fault with the name—I had always given it away to anyone interested as Saxifraga Cotyledon x balcana. If your correspondent, Mr. Arnott, has not got it I shall be very pleased to give him some.

John Grimes.

Avondale, Tydraw Road, Cardiff.

Savoy Early Ulm

I bear witness to the value of this fine little Savoy. It is sometimes said that there is little or no need for early Savoys, but my opinion is that, toward the end of the season, a tender young Savoy is more to the purpose than a Cabbage which has seen its best days. The variety under notice is quite small. It is not objectionably strong like some other Savoys—that is, it is not so strongly flavoured, hearts in quickly, and may be planted as thickly as Cos Lettuces. Served whole or in halves, and braised instead of boiled, I guarantee that this Savoy will find favour from the epicure. Plants may be put out now.

A Scottish Gardener.

Coast Hydrangeas

The blue Hydrangea is the show flower of the Atlantic coast from Virginia to New York. It might also be called a shore flower, for the same intense blue cannot be obtained very far inland. Visitors, enchanted by its blue masses against foundations and forming hedges, endeavour to learn the colour secret.

"Old horse-shoes planted at the roots" or "blueing water applied every Monday morning" are as good explanations as any, for the florists do not know themselves. A more poetic one is that it takes on the blue of sea and sky. The salt air is generally held responsible, but that theory cannot be relied upon either, for this lovely flower is not always "true blue." Some seasons its blooms are pink! Nor can the colour be forecast.

There are pink Hydrangeas also along these shores that are planted pink and pink remain. Both pink and blue produce heads of bloom of mammoth size which frequently measure a foot across.

Not so usual or so showy is the single Hydrangea, which is also naturalised on these shores, but it is very beautiful. It is flat in shape, with a tufted centre edged by a single row of flat petals. It sometimes deepens rose in colour. When planted alongside the blue and pink double ones an exquisite colour combination is produced.

Emma Dabney.

Olearia semidentata

THE accompanying photograph of
semidentata may interest some
readers. This shrub is not g
acknowledged to be hardy, even in
and when it was planted here wise h
clared it would stand no frost. It
eight years old, it is 5½ feet high an
through, and it withstood 20 degs.
which was registered here in April
and again this winter when 20 de
again recorded. The photograph wa
in 1928, and the shrub is once more
with flowers. Near it stands anot

t all but one plant this year. At first prepared to blame the hoe, but since g Mr. Des Vœux's note in your issue 25th ult., and the fact that I had had s losses, I am forced to the conclusion ese plants do not like a heavy, holdld soil. G. C.
ex.

Carpenteria californica

In reference to Mrs. Robinson's and "W. McG.'s" note on Carpenteria californica, it is, I think, much more hardy than is generally supposed. Planted here under a south wall it was only very slightly singed in the winter of 1927-8, and quite untouched last winter. Apart from its position, it had no protection. C. PRENTIS.

Posiers, Borden,
Near Sittingbourne.

Border Carnation raising

One of the most important items in the treatment of Border Carnations is to see that the shoots are secured to stakes. The ties must not be too taut, otherwise the shoot will become crippled. The rings are excellent for the purpose as they can easily be drawn up the stake as necessary. The thin tips of Bamboos are the best to use, are not expensive, and will last for a number of years. Older clumps are best staked by applying some slight twiggy sticks, and several should be placed around each plant, connecting them together with some soft twine, such as tar twist or green twist. Disbudding is another item to consider, especially if the blooms are required for exhibition.

The side shoots should be rubbed out when large enough to pinch with the thumb and finger. It is a mistaken idea that the Carnation requires a great deal of water and food to get good results, as, like most grey-leaved plants, it will stand a good deal of drought, providing the bed is well prepared before planting. Whilst the roots do not require a deal of artificial moisture the foliage receives much benefit if sprayed each evening after very hot days. A pinch of salt in the water can also be recommended.

If the beds were dressed with bone-meal in their preparation this will now be doing good work, and to supplement it at the present there is nothing better than a good dusting of old soot. The bed should be blackened over, afterwards working it lightly into the soil with the hoe or hand-fork. This may be either watered in with a rosed can or be applied just before rain. If the soil is on the poor side and did not have bone-meal when made I find Ichthemic guano a reliable food to give now.

There are three pests in particular to beware of that are partial to Carnations, viz., Red Spider, Green Aphis, and "Cuckoo's Spit." The former usually attacks the plants during hot, dry weather, but if the plants are regularly syringed in the evening there should be little trouble. The Green Aphis is a pest that does a good deal of injury to the young shoots by sucking out the sap. Spraying with Abol Insecticide never fails as a remedy if properly applied. Dipping the tips of the roots in a basin of soapy water to which a little paraffin has been added is used by many with success, whilst others use the Aphis brushes. Whatever method is adopted should be done as soon as the pest is detected. The froghopper is another insect that does a lot of damage if left to their own resources. It takes a good deal of force to dislodge them with the syringe, and really the best way is to crush them between the thumb and finger. There is no need to wait until the blooms are over before the plants are layered, or at least the young shoots which have not flowered, as the sooner they are done the better when long enough to bend down to the ground. Allow 3 inches or 4 inches to stand above when pegged. A compost should be prepared by mixing some loamy soil and sand together, and passing it through a ½-inch sieve, and a top-dressing of 2 inches to 3 inches should be placed around each plant which is to be layered. Enough should be placed around each to accommodate the roots of each layer.

W. E. WRIGHT.

Drying Everlasting Flowers

The best way to dry Everlasting Flowers generally is to tie them in small bunches and hang them with their heads downwards in a rather dry room, where there is not much fire used, and they are kept a good distance from it. They should be tied in bunches with not more than a dozen flowers in a bunch, and be tied near the end of the stalk. In this way they will keep quite straight and must be allowed to become thoroughly dry before removal. They will keep stiff and can be worked up in bouquets or be packed in boxes for future use. They will last for years if put in a moderately dry place and the dust is kept from them. To preserve them nicely they should be covered with a glass shade. The Helichrysums, Xeranthemums, and Rhodanthes are best treated in this way. All Everlastings should be gathered before they are fully open or they show their eye too much when finished.

The Raising of Hybrid Asiatic Primulas

In this, the largest portion of the genus Primula, there are comparatively few hybrids, and these do not always possess that constitution which is vital to a good garden plant. Many of the enthusiastic cultivators of this family should therefore be encouraged to endeavour to raise improved stocks of known varieties, or by crossing selected species to produce a novelty of real merit. It is a fascinating work, not only in the actual hybridising of the plants concerned, but even more so in the possible results.

As regards crossing, do not merely use any two species or varieties and trust to luck that a good seedling will result. Rather hybridise in such a way that two desirable characters may be united in one plant, or that the vigour of a certain species may be imparted to another which lacks it. The section Candelabra has been used more than any other for this purpose; probably because it has a greater number and variety in cultivation than other sections; the flowers are also large, and the parts easily manipulated.

P. pulverulenta x P. Cockburniana has produced Red Hugh, Unique, Aileen Aroon, Lissadell Hybrid, Sir Frederick Moore, and Lady Moore—all of varying shades of flame, scarlet, or vermilion. Unique crossed again with P. Cockburniana gave Excelsior, of a rich cherry-red, and in habit resembling the latter parent. P. pulverulenta x Red Hugh was shown at Chelsea in 1928, but the only noticeable difference from the former was a slight toning-down in colour. The pink-flowered strain of P. pulverulenta is not, of course, of hybrid origin, but arose from a sport. P. Cockburniana undoubtedly lacks stamina—it is usually biennial in gardens—and as a parent it has now been superseded by P. chungensis. A hybrid between P. chungensis and P. pulverulenta has been shown in which the flowers are of a salmon-pink shade, while the vigour of the plants is remarkable. Introduced by Captain Kingdon Ward, this is a perennial species of undoubted vigour, flowering in late April and early May; in colour it is a shade lighter orange than P. Cockburniana, the outside of the petals being tinted scarlet.

P. Bulleyana and P. pulverulenta were the parents of Inverleith, a deep salmon-coloured hybrid; the reverse cross, having P. pulverulenta as the seed parent, produced Ladybird, of a deep rose shade, with a dark eye. P. Bulleyana has also been mated with P. Beesiana, resulting in a series of colours from orange-red and apricot to rose and lilac. Edina is a salmon-flowered variety from this cross. The former species is a good grower, and for introducing such tones is undoubtedly useful; one factor which nearly always shows
in the progeny of P. Bulleyana is the
tinge on the midrib of the leaf. P. B
x P. pulverulenta exists, but, as I ha
it, is an ugly shade of washy rose, a

top-dressing of fine sandy soil. In a
re winter overhead shelter may be neces-
; but good drainage, combined with a
al supply of sand on the surface, will
healthy seedlings through most weather

conditions. Of course, it should be understood that outside sowing is only for those who have not the necessary accommodation under glass, but at the same time it can be very successfully accomplished.

One other point: remember that the second generation of plants from a hybrid origin will in all probability show considerable variation; and from this point onwards seed selection from the most vigorous and promising plants should begin.

B. O. M.

Guelder Rose: A snowstorm in June

Guelder Rose: A snowstorm in June

THOUGH the recent winter was hard and long it has had no bad effect on the blooming of the ordinary flowering shrubs; in fact, some of them have been more than usually bountiful of bloom. Never was such a mass of flower on the Guelder Roses. The camera was nearly a week too late to catch them at their best, but has faithfully recorded the effect when the bloom was half fallen, for it shows the ground below the bush and the near seat looking as if a heavy fall of snow had come upon them. Guelder Rose is a bush or small tree for many uses. There are wall spaces in cool aspects where, if it is trained to the wall and only allowed to grow a little way forward, it forms a capital covering, and if a Clematis montana is trained to run through it the two flower together with pleasant effect. As is generally known, the round white ball of the garden Guelder Rose is formed by a kind of doubling. The little tree Viburnum opulus in its wild form is a native, but with a flat flower that is not showy. It has a ring of sterile florets on the outer side and a disc filled with fertile bloom. It is, none the less, a desirable thing in the garden, for the flat bloom turns into a mass of berries that have the size and translucency of Red Currants, and an even brighter colour—beautiful in September when the foliage has also turned to a reddish colour. In the garden Guelder Rose the fertile parts of the flowers are absent, their whole place being taken by the showier sterile, so forming the white ball.

G. J.

Fabiana imbricata (the False Heath)

This is a charming hard-wooded evergreen little shrub of moderately vigorous habit, and can be relied upon to do well in warm, open soil. In general appearance it resembles a Heath in the arrangement of its tiny leaves and fox-brush like growth, which is terminated by a pyramidal cluster of white tubular flowers, nestling in the pale green foliage with which the stem is furnished. The plant is hardier than some people imagine, as it flowers and thrives here in the open without much protection. It may be used in various ways in the rock garden as a specimen plant, or in masses regulated by cutting, or associated with other flowering shrubs. In either case, perfect drainage is essential. The plant forms compact, well-proportioned specimens 3 feet to 5 feet high, but may be cut back to symmetrical form if desired.

A few years ago I saw this subject employed as a wall plant. I wondered, walking on a distant pathway, what that sunlit flower could be, and, on approaching it, there was this old favourite, a perfect sea of blossoms, fully 5 feet high. Fabiana should not be employed as a wall plant where a close-fitting subject is required, as it is seen to the best advantage when the principal branches are secured to the wall and the shoots are afterwards allowed to grow at will. By this mode of treatment the slender branches dispose themselves in a graceful manner.

It is of facile increase; every cutting pressed firmly into sandy soil during September, under cover of a handlight, will root and produce a nice, bushy plant, which may flower the following spring.

H. Stevens.

Hardy Heaths

As the species pass out of bloom remove the seed-bearing growths, cutting them at different levels in order to avoid a shorn appearance. Many, indeed most of the Heaths, derive considerable benefit from a good cutting back, providing this is done immediately their flowering period is over.

An Alpine Nursery at Llandudno

AN enthusiastic hardy plantsman was so impressed by a recent visit to Mr. Statham's nursery, Queen's Road, Craig-y-don, that he was inspired to write as follows:—

Provided with the beautiful limestone rock of the Ormes, than which no better material exists, Mr. A. L. Statham has created a rock garden which is admirably suited for the accommodation of plants and the display of their individual charms. In the construction of this rock garden the visitor who is on the look-out for hints will find much that is really helpful. Practical knowledge and intuition for artistic design, coupled with that inborn skill which marks the good plantsman, have together produced a garden of infinite delight; and when one knows how easy it would have been to make that old Cabbage patch a few years ago more akin to a stone quarry than a rock garden one's admiration for its founder is warmed with a certain sense of gratitude.

Statham's rock garden, Llandudno

And so to the plants. At the time of my visit, towards the end of May, the place was a riot of colour. Predominating in every conceivable shade of purple, violet, and pink were the Aubrietias which Mr. Statham grows to a rare perfection. Indeed, in size and quantity of blossom I have seldom seen these equalled anywhere. All the good old sorts, the blushing Bridesmaid, the violet Dr. Mules, Lloyd Edwards in royal purple, and the incomparable Lavender, were massed in splendid mounds of colour. But not less striking than these were some of the newcomers—the wonderful Gloriosa (a superb variety in clear, rich rose), Russell's Crimson, the brilliant crimson Magician, and Bonfire. To these novelties must be added Miss Statham, a variety (raised at this nursery) with very large flowers in a rich soft lavender, a lovely plant of great promise.

The next group to grip my attention were the Saxifrages. These were also in unusual vigour, and here again Mr. Statham had proved his determination to be up-to-date by having on view fine patches of the most recent novelties. I was particularly taken with some of the Mosses, a trio of superb whites being James Bremner, bathoniensis alba, and Miss Willmott, whilst among the most striking of the crimsons were Wenlock Best of All, Marshal Joffre, and Pompadour. Again in this section was noted a variety labelled Miss Statham, a very neat, close grower with clear rose flowers rather later than the rest. Nestling in the limestone crevices were many of the choicest of the encrusted Saxifrages, delightful things with foliage like silver filigree and airy flights of white or rosy blossoms. In these I "spotted" Dr. Ramsay, which caused a sensation at Chelsea a few years ago, that priceless treasure Cochlearis minor, and conspicuous in another section was that exquisite dwarf London Pride, Elliott's Variety (found in the Pyrenees), and one of the best rock plants ever introduced.

Mr. Statham has a keen enthusiasm for Sedums and Sempervivums, and of these he has gathered a really representative collection, numbering over 50 species and varieties. These include all the well-tried, as well as some of the rarer sorts, and even in this difficult genus, as elsewhere, I noticed an accuracy in nomenclature, which is none too common in the nursery world.

The Bellflowers ring their individual praises with no uncertain sound in these rock gardens, and it is some time since I ran across such a tempting lot of these indispensable summer bloomers. Here again were over 50 sorts, all of the choicest. To name but a few, there was the incomparable Campanula Miranda in silver grey, the rare C. allioni, Profusion with its subtle blend of pale blue and gold, that brace of beauties, Steveni nana and Stansfieldii, pulla in royal purple, the violet-starred arvatica, and a whole nest of those fairy-bells of the Pusilla household. Dianthuses were equally well represented, not only in numbers, but in such gems as neglectus, alpinus, and the best of the Cheddar pinks. Here also were some of the most famous of the old and new hybrids, notably Fettes Mount and Gladys Cranfield. Coming into flower with these, and even excelling them in the brilliance of their colour and infinite variety, were the Sun Roses, and it is a long while since I have been tempted by such an array as these. Helianthemum carneum and Chamæcistus still unrivalled in their own colour, and the rich wine-red E. T. Bowell were in especially good form. In rock garden Veronicas there was a wide selection, both shrubby and otherwise. The beautiful Grecian Violet, inimitable in its grace, was represented by some lovely patches, and a well-filled notebook records the presence of that wallflower-red marvel,
Viola Arkwright's Ruby, as well as
other notable kinds, not forgetting the
Pansies, in which Mr. Statham ha
specialised.

In concluding these expressions I mu
omit to allude to one or two well-gro
dividual plants. I was just in time
some "topping" specimens of the d
Gentiana verna, whose secrets Mr. St
has evidently discovered. Another

Greenhouse Creeping and Twining Plants

ERE is something arresting about the oof of a greenhouse covered with eeping and twining plants, from which s depend, and provided they are not ed to unduly shade the house, little ion can be raised. A judicious use of ers is rather an advantage than other- as it serves a twofold purpose in just ting enough shade to act as a screen the sun. In a general way, plants in- d for covering rafters are best grown ts or tubs, as, should necessity arise, can the more readily be removed out ors, a decided gain in the case of some cts. In considering what may be grown is purpose, it is well to observe that rowding ought to be avoided, and in a of moderate dimensions one or two s at the most will be ample. Wires n under the rafters and secured, leaving of about 9 inches or 12 inches to the so as to prevent the foliage touching the will be necessary. For a house where is kept up during winter and early g only, one may select creepers that will l much beauty, once they have become ished. Among suitable plants are :—

pagerias rosea and alba. These are iful tubular shaped flowers, borne under e of pleasing green. Blossoms are rose white respectively. It needs a compost up of three parts peat to one of loam, sand and charcoal added, and good age. Lapagerias dislike a dry, hot at- here, and do best when planted in a e which gets partly shaded in the day, or the glass is obscured during the hottest weather by a "wash."

Tecomas, of which capensis, with orange-red flowers, and T. Smithii, yellow, are handsome climbers for a house. A similar compost to the foregoing is required, and while standing the sun, they must have plenty of air in the summer months.

Clianthus, the Glory Pea, C. Dampieri (red), and C. puniceus (crimson) are handsome flowering plants. The former may be raised from seed sown in peat and sand in the warmth of a greenhouse in spring. They are suitable for planting in 8-inch pots in a compost of peaty turf and sand. C. puniceus is much stronger in growth than C. Dampieri, needs to be syringed frequently in the summer, and must not be allowed to suffer for water at the roots.

Jasminum primulinum has pale yellow flowers. Plants need a warmer temperature in winter than the usual run of greenhouse subjects in that they should be kept in an atmosphere which does not fall below 50 degrees. Leaf-mould, loam, rotted dung, and sand incorporated forms a fitting compost. Syringing during summer is beneficial in their case also.

Clematises of the Lanuginosa or Jackmanni group may be grown in a cold house the year round. In the first named section such varieties as Alba magna, a pure white with broad sepals; Enchantress, double white, flushed rose; and Marcel Moser, mauve-violet, make handsome roof climbers. In the Jackmanni group, Star of India, reddish plum; and Jackmanni alba, white, are two charming kinds. The variety Indivisa lobata is essentially a greenhouse plant and yields quantities of white blossoms. A compost of loam, leaf-mould, rotted manure, with ample drainage, should be provided.

Tropæolums of the tuberous rooted section make handsome flowering creepers for the house. One old variety, T. lobbianum, has bright red flowers, and yields them during winter and early spring months in a house kept moderately warm. They grow very quickly, and can be propagated from cuttings planted in pots of sandy soil and dibbled in the warm bed of a propagator. A light soil of loam and leaf-mould suits this variety, and it may be grown in comparatively small-sized pots—6 inches. It flowers better when in a cramped-at-the-roots state, provided it is not starved for water, and is given weak liquid manure as it is approaching its blooming time.

W. F.

Saving delayed nursery stock

Writing in a recent issue of an American contemporary, M. G. Kains has some interesting points to make on the procedure when nursery stock, delayed en route, arrives dry and shrivelled. This is often no fault of the nurseryman, or of anyone else, but causes much trouble, often litigation. The writer gives instances of making the best of the matter, as follows: "One shipment of trees and one of berry plants arrived with the buds started, and even with leaves formed. The roots were dry also. As the ground was moist, they were planted the day after receipt, having been drenched the night previous with several buckets of water. Two other shipments, one of Nut trees and one of Grapes and bush fruits, arrived so dry that many of the plants in the latter were brittle. As it was impossible to plant the trees for several days they were buried in wet, light 'chip dirt' in a cold shed. The berries and Grapes were plunged in tubs full of water and kept there 24 to 48 hours—in some cases even longer.

"In planting them only a few holes were made at a time so the earth would not become dry, and as each Vine was set the soil was tramped down hard with the heels. A layer of half an inch or so of loose earth was then spread over the packed soil to check evaporation. Finally the plants were cut back severely. Fortunately a rain had preceded the berry and Grape planting, and another followed in a few days. As soon as the ground dried after the latter, the surface crust was hoed to establish the looseness again. Cultivation followed in a few days.

"Seventy per cent. each of Currant and Raspberry and slightly more than 50 per cent. of the Blackberry plants grew. Only three out of 176 Grape Vines failed. Of the dozen Nut trees four failed."

From this and previous similar experiences, the writer lays it down that "the best course to pursue when shipments are seriously delayed, is first of all to demand a bad order receipt from the transportation company to establish a claim, if necessary; second, immediately to notify the shipper of the condition of the stock upon arrival, telling him of the bad order receipt and asking for an adjustment in case the plants fail; third, to take the precautions outlined above; fourth, to make a report to the shipper, say a month after planting, to show just what success has been attained, and one's own fairness in the matter. During many years' experience I have always found nursery companies willing to meet me half way in making an adjustment.

"On other occasions, I have buried fruit trees, tops and all, in moist earth, even wet ground, for a week or more and had 100 per cent. success after they were planted. When a pond or a stream has been available, soaking for a couple of days has also given good results."

Marechal Niel: A beautiful long-service Rose

I became enamoured of Marechal Niel in the late 'seventies when I began to grow it in a house with very little heat. It had been introduced some years prior to this, but up to then it had not been distributed largely among amateurs. Not long afterwards the name was on almost everybody's lips who owned a greenhouse, and it advanced in popularity by leaps and bounds. One would be well within the mark in characterizing this Rose as the most popular one for indoor growing of its day. It had splendid testimonials as to character for indoor culture, comprising sweetly-scented flowers, of a beautiful yellow colour, clean leafage, and a most prolific bloomer. There were those who were not satisfied with these credentials, as they took exception to its inverted habit, the blooms being different to most Roses. I could never see that this was a fault in a blossom otherwise so perfect; rather was it deemed to be an advantage for a variety whose blossoms depended from the rafters in many a house, and could easily be seen. At any rate, in my judgment, there has never been a variety among yellows that approached old Marechal Niel. But it had one fault which soon came to light in that plants of two or three years and upwards often showed signs of canker, mostly near a joint. This was more marked among plants under glass than among those grown out of doors; but except in favoured localities it was never seriously regarded as an outdoor variety, its proper place being a cold house, or one where little heat was applied. This fault showed itself mostly where trees had been planted either in a border within the house or outside and the branches brought in. It was thought that lack of sufficient air and—as summer advanced—a too-heated atmosphere accounted for the plague—for such it became—hence many dropped this plan and planted in large pots or tubs, so that after the blooming season, when cutting-back had taken place, the pots could be turned out of doors and quartered under cooler conditions. If a plant was kept long enough, it eventually developed canker, so that it became quite a common practice to propagate from layers or cuttings, and grow these on with a view to bringing them indoors for filling the place of those which had failed. Moreover, it was found that the finest blossoms were nearly always produced on plants two or three years old. Budding on briers was no antidote to canker, as many found out, although it was asserted, and, indeed, appeared to be the case, that the colour of the blooms was more intense than on own root plants. The fact that Marechal Niel is grown to-day proves, I think, that it is really a remarkable Rose, and added to this that a variety that was first introduced in the 'sixties should have survived all these years and be put up in competition with modern varieties goes to show that it has great vitality, and is worthy of being placed among the best Roses for indoor culture. It is not done with by any means, as orders are frequently being received by the trade for plants in pots for indoor culture. Given good loam, rotted dung, with coarse sand in pots or tubs well drained, one may—notwithstanding the handicap referred to—have much pleasure and profit from this good old Rose, and if one can give it a few months in the open air after it has flowered and been pruned, the chances are that it will live to a healthy old age.

Saintpaulia iolantha

This beautiful little plant belongs
Natural Order Gesneriaceæ, and is con
known as the African or Stove Violet
a native of Central Africa, and wa
introduced into this country towards
of the nineteenth century. It forms a
of very dark green, oval, spoon-
leaves, from the centre of which the
bearing beautiful violet-shaped flower
deep violet colour arise to a height of 3
to 4 inches from May to October.

Saintpaulia iolantha should be po
March or April into well-drained 3-i
4-inch pots, varying according to the
the plant, in a compost of loam, pea
mould, and sand. It requires an abu
of water during the summer, but
watering during winter, and is to be
in a temperature of about 60 degs. to 7
Fahr.

It is easily grown, and has been
even to thrive in the shingle on the

wing Tomatoes out-of-doors

vagaries of our English climate are that in certain parts of the country at growing Tomatoes out-of-doors will s be attended with risk. But the hope better season buoys one up, optimism us on to try again, and we make gements for planting out. It is always to wait as long as possible until genial ions prevail, rather than attempt to get out early. May is, in most quarters, too soon to try the experiment, as one against extremes of temperature, mid-unshine and warmth being succeeded osty nights, which, if it does not kill outright, at least cripples them for a In the circumstances, June will be early enough, the plants in the mean-being kept under frames where they can vered at night with mats, if need be. ne having experience with Tomatoes dream of giving them any other posi-han the sunniest, and if a shelter of a or fence can be made use of, so much etter. Were I contemplating putting s out of doors this year, I should choose a position and select the strongest plants f pots at present in my greenhouse. It seless to attempt to plant out small s, "left overs" from the stock of s, and thinking by some sort of coaxing an make up for lost time. Some varie-re of more service for outdoor growing others, and most firms list such, and e right time advertise plants for this cular purpose. In planting, it is well ovide them with something better than ary garden soil, and it will be found ul to dig out a spit or two of it and substitute old loam with a little sand. No manure should be introduced at the time of planting out, stimulants of that character being left until the first truss of fruit has set. Soil charged with manure at the first onset simply predisposes to exuberant growth at the expense of fruit. The single stem system is the only one worth attempting out-of-doors, whatever views we may hold in regard to culture of plants under glass. I advocate the growing of Tomatoes outside, planted as near to a wall or fence as possible, the reason being that heat is reflected from them, and, further, if one has any spare frame lights (and sometimes in the summer these are idle), they can be reared up against the wall, and so a miniature greenhouse is formed and fruit ripens up much quicker. Tomatoes ought to be planted well clear of each other, and nothing should be permitted in front of them likely to impede light or sun. W. F.

Leeks

Those who grew Leeks for the first time last year found that while the Cabbage tribe fell victims to the severe frost and died off, Leeks were affected least. It is this fact which has led many this spring to make a sowing of seed for planting out a larger area. It ought not to be lost sight of that there is very little waste about them; in fact, all the leaves may be cooked. Further, once planted in good ground they are of little trouble, and, what is of equal importance, are not bothered with the fly like Onions. For those who at the moment have a bit of vacant ground and can enrich it with a little manure or vegetable refuse, or, failing these, an approved artificial manure, what is easier to plant than Leeks? You well dig a piece of ground, working in the manure, then draw your line, push your dibber down, and drop in the plants up to the tips of the leaves. That is all. The soil will trickle down the holes and fill up in due course. For a general crop for a family supply you can plant 6 inches or so apart. Plants can now be purchased, and if the ground is made ready they will soon get established and push along. A pinching of the tips of the leaves two or three times between now and November, and liquid-manure given occasionally, will ensure a good serviceable crop of one of the finest vegetables one can have in winter.

W. F.

Young Carrots for winter

There is no difficulty in having a good supply of Carrots in winter. Now is the time to sow for winter supplies, and the best varieties are the stump-rooted kinds, those one usually sows in the early spring, such as Early Nantes, Early Gem, or a Short Horn. These should be sown thinly in well-manured soil, and should the weather be dry it is as well to water to assist the seed to germinate freely. With winter Carrots one must guard against slugs, wireworm, and other pests. The wireworm is one of the worst, and it is well to dress the land before digging, with lime and soot, and in soils with a tendency to wireworm gas-lime should be employed. Wood ashes is a splendid fertiliser if this can be used in quantity, and in heavy clay soils the addition of road scrapings, old mortar rubble, or spent manure is of great value. There need be no fear of the crop failing. Carrots are quite hardy, and they are much sweeter when drawn fresh.

REMINDERS FOR THE WEEK

Southern and Midland

Indian Azaleas

The time has arrived when these, and many other forced shrubs, should be removed from the houses to a sheltered and partially shaded position in the open air, the pots being plunged in a bed of ashes. Growth is almost completed and buds well set, but the plants must not be permitted to become unduly dry at any time; daily syringings are necessary following hot, dry days, and most beneficial, as by this means the troublesome attacks of thrips are kept down. Should the latter present itself, the plants should be laid on their sides and well sprayed with a solution of paraffin soap, at the rate of ¼ pint of the latter to 1 gallon of water. Deciduous forced shrubs should be plunged in ashes in full sunshine and kept well supplied with water. Occasional syringings overhead are beneficial.

Decorative plants

With the exit of all bedding plants, specimens in tubs, etc., which congested the houses for so long, space becomes available for the free and more natural development of those choice subjects which are to provide us with flowers in the near future, such as Liliums, Tuberous Begonias, Verbenas, Hydrangeas, Fuchsias, many lovely annuals, and tuberous-rooted flowers. These should be neatly staked and gracefully arranged in order to be seen at their best, and where conservatories or flowering houses have to be maintained, no harm will result from the introduction of groups of perpetual flowering Carnations for a few weeks, as air may be admitted night and day.

Vineries

Should the heat and bright sunshine become exceptional, it may be advisable to spray the glass lightly with whiting, as this will prevent scorching of the leaves, a not uncommon occurrence following a spell of dull weather. While stagnant conditions of the borders must be avoided at all costs, ample moisture must be given at this season.

Peaches and Nectarines in the open

These have, in spite of the serious late frosts, set fairly well, and are now in process of stoning, so little change will be noticeable during the next few weeks. Established trees growing on south and west walls dry out very quickly and must be amply supplied with moisture, and if the crop is a heavy one, a weekly dose of diluted manure water will assist in swelling the crop. The same applies to Figs and Apricots. Syringe the trees every fine afternoon, driving the water briskly among the foliage and thus prevent the spread of Red Spider and other pests.

Pears

Push forward the thinning of the fruits (a big job this year in some gardens) and avoid over-cropping, for not only does this exhaust good trees, but the fruit is of necessity poor in quality and size. It is scarcely possible to over-water Pear trees carrying a crop.

Mulching

All crops derive great benefit at this season from a liberal mulch, and such should be applied wherever possible, as it not only conserves moisture but proves a labour saver; therefore, mulch with lawn mowings thinly, or even other grass if better material is unavailable. Azaleas, Rhododendrons, and other flowering shrubs such as Lilacs, etc., derive immense benefit from a rough mulch of leaves, Bracken, or grass.

Roses and Clematis

Tie in the shoots weekly and thereby guide them easily into any position, an impossibility when allowed to become entangled. Give abundant supplies of water, especially to those growing at the foot of hot walls, and should Green Fly prove troublesome with the former, spray the plants with Abol or quassia and nicotine wash.

Snowdrops, Belladonna Lily, Sternbergia, Crocus speciosus, Nerine Bowdeni

These and similar subjects may, where necessary, be lifted and divided to form fresh plantations, and to those who do not already possess these charming subjects I would say place your orders without delay and plant in well-drained soil.

Broccoli and Cauliflower

Continue to plant a few of each—as ground becomes available—from the late sowings, especially the valuable purple sprouting varieties of Broccoli, and make the final planting of Celery for late use.

Staking, mulching, and watering

These operations will demand constant attention among growing crops and must, in some instances, be accompanied with frequent applications of liquid manure.

Runner Beans

These must be staked when 1 foot high, and further sowings of dwarf kinds made every fortnight; the same applies to Lettuces of both kinds. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Late Chrysanthemums

If not yet done, the final potting of this important subject should immediately receive attention. Even when only grown for greenhouse or conservatory decoration, and for the production of cut flowers, a very substantial compost is desirable so as to get the best out of the plants. Clean, well-drained pots are essential, while the soil must be rammed very firmly round the roots. Set on a hard bottom in a sunny, yet sheltered, position.

The potting of young Cyclamens

Should the small pots at present occupied be well filled with roots, it will be well to proceed with the shift into the flowering pots. Those 6 inches in diameter are suitable for the stronger specimens, while the 5½-inch and the 5-inch sizes may with advantage be used for the smaller plants. Thoroughly clean and very carefully crocked pots should be used with a compost of the sweetest and most fibrous description procurable. Return to same temperature and water with the greatest care at all times, but more especially for some weeks after potting.

Winter-flowering Begonias

The final potting of these useful subjects should now have attention. The "Lorraine" type make excellent hanging baskets. If decent old plants be placed in 7-inch pots and given a little care, they can in due course be set in wire baskets and hung up in the conservatory or greenhouse. The staking and tying of the other kinds should have attention as soon as required.

Transplant biennials

If still in the seed bed, it will now be necessary to either plant them where they are to flower, which is the best plan, or else in nursery rows. It is so seldom that the first alternative can be followed out that it is
almost useless to mention it. Select
spot in the kitchen garden and se
rows 1 foot apart and the same bet
plants in the rows. This applies to
bury Bells, Wallflowers, and Ca
pyramidalis. The others may be
somewhat closer, the smaller, indee
better in boxes in a cold frame un
enough for planting in the open.

The border Auricula

This dainty early summer dwa
should be lifted, divided, and replant
second, or, at most, third year, and
sent time is well suited for the carr
of this work. Should it be desired
the same site for these plants, it
necessary to remove the top spit and
with fresh soil from one of the v
quarters.

Primulas in the rockery

Such gems as P. nivalis, P. helvet
its Hybrids, P. Juliæ and its Hyb
Cashmireana, etc., should, about
second year, be lifted and fresh soi
duced to the sites they occupy before
replanted.

Keep an eye on the Rose beds

While disbudding is not quite such
item at the beginning of the season
when the second and subsequent "
of bloom begin to develop, still it rea
to give some little attention to the
of reducing the number of buds, whe
are at all crowded. Should the weath
tinue dry, a thorough soaking of clea
at the roots will be most welcome
bushes.

Melons

As the fruits approach the ripenin
very careful watering is necessary.
actual dryness must be guarded agai
freqeuent supplies rather spoil the
and may, at times, cause splitting
fruits.

Turnips

Continue to thin each sowing as it b
fit for this operation, and hoe the soil b
the rows frequently. Another sowing
white and yellow varieties may now be
and even Swedes will still succeed if
at once.

Spring Broccoli

The plants should now be fit for
out in their permanent quarters. The
must be very firm and only very mod
rich. Ground that was well manure
previous crop is suitable and ne
be dug. If planting can be carried o
after rain it will be much easier than
dry weather.

Maincrop Celery

There is still time to plant this ve
portant crop, but no further delay sh
made. Drought is the chief foe
vegetable, so at no time must the soil
roots be permitted to get anything li
Before planting, the trenches should
moistened, as should the soil in wh
plants are growing so that a good ba
be had with each. Another drenching
be given in the evening followin
planting.

Maincrop Leeks

As soon as ever the plants are large
have them set out in their permanen
tions, selecting a well-worked and
manured site for the purpose.
weather watering will be necessary un
plants become established. C. B

Paper mulching

ould seem that the use of black paper
for various crops is becoming an estab-
practice in America, following on the
obtained by its use in Hawaii, where
first used for the sugar crops. The
ple growers then took it up, and last
per cent. of the Hawaiian Pineapples
produced under paper mulch. The
States Department of Agriculture has
ted itself to the extent of making ex-
nts and issuing a bulletin on the sub-
It is said to smother weeds, provide
trap, showing an average increase of
to 2 degrees over ordinary soil, and pre-
ne soil drying by evaporation. We
speak from experience of the advan-
of paper mulching, about which there
een correspondence in these pages
ny. One writer in the United States
nends the practice for young Rhodo-
ns, Azaleas, and Hollies, not only as
ulant, but also as it eliminates the
of keeping the grass back. For suc-
of crops it is also recommended; for
le, with Beans following early Peas, all
necessary being to pull up the Pea
without disturbing either the paper or
il, and plant the Beans in the 1 inch
paces between the paper strips from
the Peas were pulled up. It is claimed
e same paper can be kept down for
years, with plantings occupying the
l all the season, after only slight pre-
rry soil preparation, and yet the yield
ier than with no paper and the cus-
soil cultivation and preparation. The
d of use appears simple, either by
ng between strips of mulch paper as
examples given, by cutting slits in the
e and putting plants through them, or
ting collars of paper round the plants.

Top-dressing

e is no doubt that where mulching is
cusly carried out it is highly beneficial
flowers, fruit, and vegetation gener-
It should be noted that top-dressing is
in a dual capacity, first for the nourish-
of the plant and secondly to conserve
isture. At the same time, evaporation
great extent prevented by keeping the
en and deeply stirred. We have com-
vely little sun even in favourable sum-
therefore in dealing with a large num-
plants nothing in the shape of non-
ting material, preventing the soil be-
ig warm and inducing rampant sappy
, not good fruit or flowers, should be
on the surface.

lvise the use of the hoe in place of
mulchings, particularly on retentive
riched soils. If it is applied let it be
coating, or take care that the whole
e be not covered, which will allow the
penetrate and aerate the soil. A great
owever, depends on the subject under
tion. Take Violas and Pansies, that
n cool and moist surroundings. They
greatly benefited by covering up the soil
efore the young plants can do so, but
t Pelargoniums or many Dahlias thus
be a gross error, as they would largely
leaf and sappy growth. The Fuchsia,
delights in partial shade and is rather
s feeder, if given a heavy dressing of,
ow manure when bedded out would be
from a flowering point of view.

the case of fruit trees it is certainly
cial to give them support in this man-
hen bearing a heavy crop of fruit, but
ply it without judgment on heavy en-
ground is greatly against the produc-
fruiting wood and leads to the neces-
severe root pruning. F. H.

From Gardening Illustrated

Fifty Years Ago

Baskets of Roses

ROSES in a cut state are always welcome, and a tastefully arranged basket of them constitutes one of the most elegant floral ornaments that can be obtained for the decoration of the drawing-room. Three important points may be urged in their favour. Firstly, Roses will keep fresh for a comparatively long time; secondly, they are not difficult to arrange; thirdly, they can be bought for a small sum, if not growing in one's own garden, and anyone who does possess a garden, large or small, is sure to have Roses. Baskets made of different materials for holding ordinary cut flowers can be bought, but for Roses I prefer those made of glass, as the clear crystal shows up the rich colours of the Roses and their variously tinted foliage better than any other material. In glass baskets the flowers should nestle among Moss instead of sand, which, when seen through the glass, has a bad effect. The arrangement as to colours must be, of course, according to taste. . . . Opinions differ, I know, as to the propriety of mixing Ferns with Roses in preference to their own foliage, but for my own part I prefer their own leaves when the arrangement consists wholly of Roses. If of mixed flowers, then light Ferns might be used with advantage. I need scarcely add that besides Roses there are many other flowers that might be arranged in baskets for the drawing-room, and with excellent effect. . . .—June 28th, 1879.

NEWS IN ADVERTISEMENTS

A new spud, and the Sproughton rock garden hoe

AT this season, when so many readers are troubled with suckers on Roses, Lilacs, Plums, and on other flowering shrubs, the "Davidson Spud" is in great demand. This little tool, here illustrated (Fig. 1), is splendid for grubbing the suckers out from the base. We also find it useful for lifting Daisies from lawns and dragging them on to the grass to be swept away. It has been called a lazy man's tool; really it is labour-saving. The second illustration shows the new Sproughton hoe for the rock garden. It is just the right little hoe for working among small plants. These tools are made of well-hardened steel and can be fixed on either a long or short handle as desired.

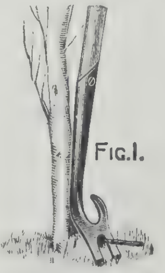

FIG. I.

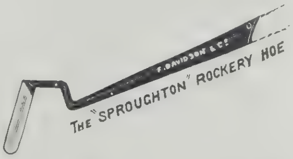

Seasonal work on Strawberries

ONE of the most important tasks at present is to protect the fruit against birds, slugs, and snails, as neither of these wait until the fruits are ripe. There is no safer plan in protecting the fruit from birds than netting the plantation. When doing this it is best to fix a rough structure of fencing or wire on which to carry the nets, and if this can be fixed high enough to allow one to walk beneath when gathering the fruit and taking runners so much the better. Slugs and snails, which are not so numerous this season as in the past, can be kept in abeyance by scattering a good dusting of soot beneath the foliage. This should be done before bedding down the plants with straw. Hay or other rubbish should not be used, as it tends to cause the fruit to rot. Strawberries are surface-rooting and suffer seriously during dry spells, so water should be given in abundance if the plants appear to wilt. If they have been well fed with artificial and other manures during spring and up to the present it is not advisable to give them any more, as it is liable to give the fruits a peculiar taste.

Where plants are required for forcing purposes the runners must be taken early from yearling plants that have been kept for the purpose and have not been allowed to bear fruit. They may be layered directly into their fruiting pots, which I have found to be better than repotting them later on. Pots 6 inches in diameter should be well drained and filled to 1 inch of the rim with good chipped fibrous loam to which has been added a 5-inch potful of each of the following to each bushel of soil:—Bone-meal, old mortar-rubble, and wood-ash or very old soot. These should be well mixed together and put in a heap on the potting bench, covered with sacks, and allowed to remain for a week or so before using.

Worms are liable to enter the pots while standing on the bed, but these can be dislodged by using clear lime-water when bringing in the plants to the frame yard, which will also benefit the plants and sweeten the soil at the same time. The first runner only should be taken, and not more than two from each plant. These should be pegged firmly into the centre of the pot, afterwards pinching the leader. When taking runners for planting they may be pegged into small squares of turf, which should be turned upside down and set in the bed to the ground-level or into 60-size pots filled with the above compost.

As beds after three years' cropping are not profitable it is a good thing to make one new bed or extend the old one by several rows each year, discarding many of the old plants. These should be chopped out as soon as the fruit has been gathered. The best site for a new bed that I know is that which was trenched and well manured for early Peas. This need not be dug, but lightly forked over, and all will be in readiness for planting, which is best done during August. Two feet 6 inches between the rows and 2 feet between the plants is a fair distance to allow.

W. E. WRIGHT.

Vermin on wall trees

Cherries, Plums, and Apricots, in particular, are liable to be attacked by various destructive insects, so it is desirable, as soon as the pests are noticed, to have these trees well syringed. Should the attack be serious, a suitable insecticide should be used, making sure that all foliage and shoots are thoroughly wetted with the solution. As with Peaches, dryness at the roots very frequently does considerable harm to the crops. A soaking of water and then a mulch of long manure spread all over the ground where the roots are will help matters considerably.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FRUIT

Apple insects

(Hurtmore).—Your tin duly arrived and contained quite a collection of insects. The weevils are Phyllobius sp. This weevil feeds on the foliage of the Apple during May and June. The females lay their eggs in the soil, and the resulting maggots feed on the roots, and continue to do so until spring, when they pupate. You will kill large numbers of the weevil grubs if you fork in crude naphthalene at the rate of 2 ozs. per square yard. The material should be forked in 6 inches deep, and should be applied in October. We found three kinds of caterpillar, viz., the Mottled Umber, the Winter Moth, and the Dunbar Moth. The first, a dark-coloured looper, brightly coloured, is a common one on Apples; the second is also a looper, but is green and generally feeds within a leaf or two spun together. The third is the largest of the three, green, with a pale head and one white line running down the back. It is not a looper. The caterpillar of the Dunbar Moth does feed on Apple foliage, but is, in the main, a cannibal, and feeds largely on the caterpillar of Winter Moth. You can do little now to control the pests, because they are practically fully fed, and most of the specimens sent have now turned into chrysalids. The naphthalene advised above will kill some of the pests in the chrysalid form in the soil. Grease-band your trees in the autumn and remove the bands in late March and burn. The main stems of the trees should then be thickly covered with lime-wash. When the Apples are in the "pink bud" stage next spring spray with the following:—Lime sulphur, 3 pints; lead arsenate paste, ½ lb.; water, 10 gallons.

Green Almonds

In Covent Garden last week I saw a basket of English-grown unripe Almonds, and I should be much obliged if you can tell me what they are used for. JEM

[The Almonds are opened with a knife and the kernels eaten as nuts for dessert.]

Pear Leaf Blister Mite

(J. Worthington).—The specimens sent for examination are affected with Pear Leaf Blister Mite, which is caused by the mite, Eriophyes pyri. This pest is very common in the southern half of England, but is not common in the northern portion. The best method of control is to spray the trees during the dormant season. In cases of bad infestation two sprayings are advisable, the first to be given as soon as the leaves have dropped in autumn and the second in late February. The Ministry of Agriculture Leaflet No. 239 gives the following mixture:—Paraffin oil, 1 gallon; soft-soap, 1½ lbs. to 2 lbs.; water, 10 gallons. The soap is first dissolved in 1 gallon of boiling water. The soap solution is then removed from the fire and the paraffin at once added, the whole being well mixed by squirting the liquid back into itself with a hand syringe. The strong emulsion may be kept until required for use, when the remaining 9 gallons of water should be added and the whole thoroughly stirred—or better, mixed as before with a hand syringe.

Diseased Walnut

(Juglans).—Incubation of the material sent for examination has failed to produce a fungus which could be responsible for the damage to the shoots of your Walnut. We conclude that the cause of the trouble must be lower down. From your description of the site where the tree is growing it appears likely that the roots of the tree are in a bad condition, and we cannot advise on any treatment of the site without a personal inspection, which is, of course, impossible. Is the tree getting enough water? Why not apply to your Advisory Service for advice? You should, in the first instance, write to the Professor of Agriculture, The University, Leeds, stating the trouble. A horticultural officer will probably be sent to examine the tree and give you his opinion. This service will be at no cost to yourself.

Cherries withering

(Cherry Stone).—The Cherries appear to be imperfectly fertilised. Are other varieties growing near to provide different pollen?

VEGETABLES

Fruit Rot of Tomato

(P. R., Durham).—Your Tomatoes are affected with Rhizoctonia Fruit Rot. During the winter the spores of the fungus live in the soil, and all your efforts at clearing the house are useless if you omit to deal with the spores in the soil. As the disease appears to be bad in your houses you should sterilise the soil with formaldehyde, using a 2 per cent. solution, *i.e.*, 1 gallon of the chemical added to 49 gallons of water. Fifty gallons of solution are needed for 18 square yards, and it should be applied six weeks before planting. After the house is planted up next year and the plants are getting away well give a soaking of Cheshunt Compound applied at 4 pints per square yard. All diseased fruit should be removed and burned, and please make sure that your water tanks are thoroughly cleaned out and sterilised.

Nineheaded Broccoli

Please tell an old subscriber how to treat the Nineheaded Broccoli after cutting off one crop. I presume I can look forward to another crop. How am I to trim the stalk? Also my Six Weeks Cauliflower plants have nearly all been attacked by the little white grubs, in spite of the creosote and sand which I put round the plants. L. F. J.

[The stems, from which the various heads are cut, are trimmed back and the plants make new growth. They produce a further crop next season, but should be well fed with liquid-manure in spring after growth starts. The Cabbage-root grub is very troublesome this year and is difficult to deal with. Watering the plants with 1 oz. of Hellebore Powder well stirred into a gallon of water is, usually, effective in checking the pests. In planting all Brassicas the roots and stems should be coated with soot. Make the soot into a thick liquid with water and dabble roots and stems in this.]

ROSES

Rose Rust

(Tavy).—Your Rose is affected wi
Rust, which is caused by the fungus
midium subcorticium, Wint. This
produces three distinct types of spores
the season. The first type is prod
spring, another type is produced i
and some authorities hold the view t
June type serves to spread the diseas
wider area. The third type of spore
duced in autumn and does not ge
until the following spring, and t
serves to carry the fungus over the

FLOWER GARDEN

Lupins

(E. G. H.).—The leaves sent w
withered and broken when they reac
that we are quite unable to make anyt
them. Late frosts this season cause
siderable damage to many hardy plan
start into growth early, and it is conc
that it is this that has caused the troub
your Lupins.

Lupin flowers dropping

(C. Lake).—It is impossible for us t
the cause of your Lupin flowers dr
without the opportunity of examining
plete plant. From your description it
appear that some root trouble is the
of the flowers dropping. If this be th
you can do nothing to arrest the troubl
of taking up the plants affected and d
ing them. Healthy plants growing
should be watered with a soluti
Cheshunt Compound.

Iris inquiries

(W. P. I., Durham).—Yes, there are
named varieties of the Regelio-cyclus
Nine of the best are Charon,
Clytemnestra, Isis, Osiris, Perse
Psyche, Saturnus, and Una. The
Crusader is not of this section, it is a
flowering Bearded Iris, requiring the
treatment as the common sun-loving,
Flag Iris.

Iris seedlings

(J. B., Wareham).—The flowers d
arrive in very good condition, but so
we have been able to see them,
the Petunia red variety, bears some
blance to Ed. Michel. No. 2 re
us of Tomtit. The other flowers we
far gone to form an opinion. We
think, however, that there is any great
for any of these varieties. They

us as being distinct or an advance on g varieties. Every raiser, of course, discard thousands of seedlings. The you sent are not to be compared with w seedlings that Miss Insole was g at the recent Iris show.

ge to Water Lilies

P. C. L.).—The water vole (water rat) onsible for the damage done, and you trap him down you will get no lowers. He burrows into the banks waterside, eating the roots of plants using the banks to give way. When ed he will dive under the water and along for some distance before showmself again, although he can only ren underneath the surface for a few s. Spring traps set in shallow water e edge will secure him, and so will a shotgun, but to get him with the gun cessary to keep observation for a time. 8 p.m. is an excellent time to get these ders.

or Pansy

dener, Mon.).—The flower sent is a

TREES AND SHRUBS

num Parkeri

.—We are obliged to you for sending us of this distinct and very pretty dwarf me. The writer possesses a small plant, owth here is very slow. Such charminty bloom is, however, worth a little e. This little shrub strikes easily uttings inserted in sandy soil in Sep and kept in a cool, closed frame.

ft hybrid

lly tell me what has happened in the ng case of a parasite plant in another. lant in question is an ordinary yellow num tree about the usual size. Pracll all over it is growing what seems to t be a kind of Pink Broom (I do not it is Rest Harrow) which is practically ng the whole tree. Both the parasite e Laburnum flower together, and the is rather odd. C. G. P.

bury.

[specimen sent by our correspondent that of the Common Laburnum, but num Adami, the well-known graft , to which reference has been made in issues. The same tree, and even the branch, bears racemes of both yellow rple flowers, and sometimes flowers of l purple, the curious tufts of the s suggesting Wiche's Brooms. This vas raised in 1825 by grafting the Broom, Cytisus purpureus, on a mon Laburnum. The flowers are]

MISCELLANEOUS

ultural student

G. Chapman).—The Royal Horticul Society admits young men to study ing at Wisley. They are trained in branches of horticulture, both in the and under glass, and are also well led in elementary chemistry, biology, n entrance fee of five guineas is the harge, but students arrange their own and lodging. If you write to the ary of the R.H.S., Vincent Square, n, S.W., asking for particulars, a ctus will be sent you.

e slime in pond

Card).—Your trouble is due to Flannel which usually becomes troublesome in ater, but which gives little trouble a free inlet and outlet exists which the water on the move. Perhaps you increase the circulation. The remedy is copper sulphate, of which you will require about 1 oz. This should be placed in a muslin bag and drawn through the water until dissolved, and should the trouble reappear repeat the process in a month's time. The copper sulphate should in no way injure the Lilies or affect any fish but trout.

Stinging plants

Could you say whether the stings of Loasas tricolor and volcanica are likely to be dangerous as well as annoying, or is the effect temporary like that of our native Nettle? G. H. S.

[They are not, as a rule, dangerous, but people vary so much in their reaction to such stings that it is better to avoid them.]

Myrtle in Royal bridal bouquets

In the "Life of King Edward VII.," published by Nelson, it is stated that the bridal bouquet of Queen Alexandra was made up of Orange blossoms, white Rose-buds, Orchids, and sprigs of Myrtle, the latter being taken from the same bush as that from which the Myrtle used in the Princess Royal's bridal bouquet was cut. Would it be likely that this bush was grown from a similar cutting from Queen Victoria's bridal bouquet? Perhaps some of your readers will know the history of this Myrtle. ULSTER.

[This inquiry has been passed on to Mr. T. H. Cook, The Royal Gardens, Sandringham, who kindly replies:—We have two Myrtles which were raised from "sprigs" taken from Queen Alexandra's bridal bouquet, but I have no knowledge, neither has anyone here, where they were obtained, and have not heard they were cuttings taken from the Myrtle used in Queen Victoria's bouquet.]

Turf for examination

(J. Worthington).—The turf sample has been examined, and the cause of the trouble is soil acidity. Under acid conditions certain species of grasses die out; other species are not so affected. The result of this is that the field becomes covered with rough grass of low feeding value and all the finer grasses die out. Your best plan will be to give the field a dressing of quicklime at the rate of 1 ton per acre in early autumn. Any dead patches of grass should be well raked or harrowed before application. Follow the lime treatment by giving an equal mixture of kainit and basic slag at the rate of 8 cwts. per acre. This mixture should be given in late autumn.

Weevil for name

(K. M. Rankin).—The weevil sent is that known as the Pine Weevil, Hylobius abietis, L. This weevil attacks many kinds of young forest trees and is a great pest of many trees. Douglas Fir, Scots Pine, Larch, Japanese Larch, Weymouth Pine, etc., etc., are commonly attacked. If you write to the Forestry Commission, 22, Grosvenor Gardens, London, S.W.1, for a copy of the Leaflet No. 1, Pine Weevils, you would obtain much information with regard to the control and life history of Hylobius. We believe the leaflet is issued free of charge.

Caterpillar for identification

(Scot).—The grub sent in is that of the Cockchafer (Melolontha vulgaris). The life-history of this pest is as follows:—The adults fly during May and June, being active during the evening and sluggish by day. The female burrows into the soil and lays her eggs about the roots of plants. After six weeks the eggs hatch and the grubs begin to feed, but no great damage is apparent until the following summer, during which plants are frequently killed outright by the grubs eating the entire root-system. Feeding is continued for several years, then the grubs pupate in the soil and the adults appear the following summer. The best control for chafer grub is naphthalene applied at the rate of 2 ozs. per square yard. Spring is, perhaps, the best time for application, and the maximum result is obtained if the material is applied prior to rain. The fact that only British-grown plants are affected is only a coincidence, the adult Cockchafer being very common in and around London.

Auto cultivation in the garden

Can any of your subscribers, especially those private owners of gardens who try "to make a private garden pay its way," give me their experiences, good or bad, with pros and cons, of any form of auto cultivator or motor plough? I have found, for a Scottish garden, such value in a motor mower and in other labour-saving devices, that I am contemplating investing in something of the above sort. A. D. G. G.

Châlet Theiler, Gstaad, Switzerland.

[Some time ago, it may be remembered, there was a rather animated discussion in GARDENING ILLUSTRATED concerning the use of the horse plough in private gardens. The conclusion arrived at was that while in theory the use of the plough might be commendable, in practice its use was to be deprecated. It appears that much the same reasoning can be applied to the use of a mechanically propelled plough or cultivator. Briefly, in the majority of gardens, and owing to the presence of fruit trees, a considerable area would, of necessity, have to be cultivated by means of the spade. Further, the breaks are not, generally speaking, so unwieldy in size that the employment of a motor plough would be profitable. Such an implement would entail a heavy initial expense, and it is worthy of consideration whether that outlay would not pay for spade cultivation over a series of years. Again, the soil in a garden is, as a rule, soft, and the weight of a motor plough, even of the lightest effective type, would undoubtedly be a handicap. The querist refers to the value of the motor mower, but the cases are not on all fours. It must be remembered that lawns are usually of some extent and, above all, that the surface is firm. Admittedly gardeners are a very conservative body of craftsmen; yet, had the plough, whether motor or horse, been practicable, there is no doubt that it would have long ago been in use. Having thus summed up generally, "A Scottish Gardener" is in a position to furnish a personal experience. "Less than a dozen years ago, during the shortage of labour, a small motor cultivator was procured. Doubtless such implements have since then been much improved. My own experience was sufficiently depressing and, I may add, enlightening. From beginning to end it was a disappointment—the portions cultivated were turned over at unequal depths and the work when finished was a positive eyesore. A neighbour who came to see the work with a view to purchasing a similar implement was frankly scornful. His exact words were: 'That! It looks as if a sow had been "**plowtering**" (*i.e.*, rooting) in the ground!' And there were not infrequent delays owing to the implement getting out of order—and this continued even after the operator had gained a certain amount of confidence and experience. To tell the truth, we wore out the patience of a very patient chauffeur, and in the end the motor cultivator was relegated to the tool house, where it rusts ignominiously. On the whole then, and from my point of view, honestly given, the querist will find that in the garden the spade is ultimately the best and the cheapest method of cultivating the soil. I ought, perhaps, to add that I refer to a garden of the customary size attached to an estate, one which runs to—all over, and including fruit and vegetable breaks—from 3 acres to 4 acres. Conceivably, and in much larger gardens and where tidiness is not a *sine quâ non*, a motor cultivator might be profitably used. But, as we Scots say, 'I hae my doots!'—A Scottish Gardener."]

Various queries

(T. G. R. N. N.).—Your plant sent for name is Limnanthes Douglasii, a very showy hardy annual. Your Tomato trouble is due to Rhizoctonia Fruit Rot. Please see reply to P. R., Durham, in this issue. The Rose disease is due to Rose Rust, and for this you must cut away all affected portions and burn. Spray the bushes with a weak solution of liver of sulphur.

Soil sample

(I. Jackson).—The trouble with your soil is soil acidity, and we do not think that mixing chalk or lime with the material would enable you to grow good plants in it. The best plan, of course, would be to treat the turf before it is lifted by applying quicklime at the rate of 1 lb. per square yard, followed by an equal mixture of basic slag and kainit at the rate of 6 ozs. per square yard. After these manures had had time to work, the material should be fit for pot plants, but at least a year is required, and two would be better. If you have a stack of the turf cut, the only treatment of any use would be to mix a good sprinkling of lime with it and allow the material to rot another year. When using the treated material a little steamed bone flour and sulphate of potash should be added to the mixture when making a potting soil. Cheshunt Compound can be applied direct to most plants, but we do not think that the material would assist you to any great extent. Your trouble is due to lack of lime in the soil, and the lime has been absent long enough to set up a serious condition of soil acidity, and until this condition is removed the soil must be to a great extent infertile. There are many acres of land in your district in a like condition.

NAMES OF PLANTS

G.—1, Rose Mme. Hoste; 2, Jasminum primulinum; 3, not recognised, flowers smashed; 4, Rosa Harrisonii; 5, not recognised; 6, Rose Mrs. Sharman Crawford; 7, too poor a specimen to name; 8, Rosa rugosa Mrs. Anthony Waterer; 9, cannot name from such a poor example; 10, Rose Reine Marie Henriette; 11, Rosa rugosa; 12, Rosa Pimpinellifolia; 13, possibly R. Moyesii, but flower almost beyond recognition. Kindly read rules for naming plants.

A. E. P.—Astrantia biebersteini.

H. Simons.—1, Dianthus hyssopifolius; 2, Hieracium aurantiacum.

E. F., Hereford.—1, Saxifraga Cotyledon; 2, S. Gaudinii; 3, Polygonum Bistorta superbum; 4, Salvia pratense var. Tenori.

C. Stevens.—Scilla peruviana.

F. S. Poole.—1, The Gladwin Iris (I. fœtidissima); 2, Spiræa japonica var. Bumalda.

C. H. P.—5, Tradescantia virginica or Spiderwort. The Irises were all over and could not be named.

F. W., Ealing.—The yellow Rose is Rosa Harrisonii, introduced from America by Harrison, 1830, and now common in gardens, especially cottage gardens in Sussex, as you have observed.

Grant.—1, Trifolium alpinum; 2, Saxifraga primuloides; 3, Campanula Bowles' Hybrid; 4, Sedum spathulifolium.

A. C.—Lonicera pileata.

A. E. P.—1 and 2, Lilium Martagon, good forms; 3, L. M. album. The former are worth about 10s. 6d. per dozen, and bulbs of the white Martagon might fetch about 2s. 6d. each.

Dublin.—1, Dictamnus (Fraxinella) albus; 2, Allium Moly (the Golden Garlic).

A. M. Whitmore.—1, Syringa villosa; 2, Borecole var. Asparagus.

Belbroughton.—Not Clematis Mrs. Hope, which has satiny-mauve flowers with very broad, overlapping sepals. The variety may be Blue Gem, but flower much withered.

Yarb.—1, Viburnum opulus; 2, Potentilla Farreri; 3, Clematis Belle Nantaise; 4, Lupinus, Paynei hybrid, True Blue; 5, Sequoia gigantea (Wellingtonia).

British Delphinium Society

The first show of the British Delphinium Society is being held at the R.H.S. new hall on July 5th. Taking the entries already received, it is estimated that there will be over 10,000 spikes of bloom on which to feast the eye, and to all Delphinium lovers the show will be well worth a visit.

This is a new Society, started in September last, and it immediately secured enthusiastic support from the leading growers in the trade as well as from numbers of amateurs.

The objects of the Society are not only to increase the interest already taken in the culture of this very popular flower, but also to provide a medium for the dissemination of information regarding its development and classification. This is being done in various ways, and the Society's activities will, of course, be greatly increased as its position becomes stronger. Already the Society has undertaken the compilation of a Register, which will secure, *inter alia*, the elimination of inferior varieties, and it is about to tackle the difficult question of classification.

The amateur grower is soon made aware of the fact that there is a singular dearth of literature on the subject, and the Society hopes to meet this by the publication in its Year Book of articles by experts on various aspects of Delphinium culture, and by the collation of information which will eventually supply the material for a standard work on the subject.

Thus the work of the Society will tend to a general raising of the standard of cultivation, and in this the amateur is primarily interested and should, therefore, support the Society.

Expert advice can be obtained by members either through the columns of this paper or from the Hon. Secretary.

LATE REPLIES

Oil cask

(Mrs. Eleanor Pain).—If you skim off the scum on the surface, you may use the water without doing much harm, but should not pour it over the foliage of any plant. Eventually the disagreeable scum and smell will disappear.

Violas

("Tweenways").—Unfortunately, there is nothing unusual in seemingly healthy Viola plants dying off suddenly, and it is difficult to exactly state the reason for their doing so. It is, however, most prevalent where the plants have been grown on the same ground over a series of years. Indeed, it is almost imperative to provide a fresh site every year for this plant.

Bindweed

(H. F. R. M.).—Constant pulling up of the shoots will eventually kill out the Bindweed, but this is a slow process, and frequent hoeing is easier and equally effective. In both cases it will take a little time to entirely rout the enemy. Should you only have a small
piece of ground affected, a layer of n
or even of half rotted leaves, 9 in
12 inches thick, spread all over the
and trodden down hard will within
kill them out. This is, of course, im
on a large scale.

Annuals

(Mrs. A. J. Brdley-Dyne).—We ca
suggest that in future you sow your
seeds earlier in the season so that th
come established before the heat becor
great. If Poppies fail to germinate w
week there is seldom any chance o
ever doing so.

Ants eating Lily buds

(W. G. B.).—Tie a fair sized piece of
wool round the stems of your Liliums
ing the wool as loose and fluffy as p
on the lower side. The ants have grea
culty in crawling over this and will
soon desist.

Pyrethrum

(Ignoramus).—We notice that
Thompson and Morgan, seed spec
Norwich, offer Pyrethrum atrosangu
which they describe as "several dark
son varieties." This may meet your r
ments.

Seakale

(R. M. R.).—We presume you refer
flower-stems sent up by your Seakale
These should be cut off as soon as th
pear, for by permitting them to rema
crowns would be seriously weakened.
a good plan to cut out all the small sid
in early spring, for when this is do
flower-stems are prevented and the
crowns are much strengthened.

Viburnum tomentosum

(R. S.).—Viburnum tomentosum
species, or mother plant, and V. t. pl
is a sterile variety with showy an
beautiful flowers. The mother shrub
handsome indeed, and so is another
called Mariesii, but for a small garden
var. plicatum is much the best. Eith
be obtained from Messrs. Waterer, Son
Crisp, The Nurseries, Bagshot, Surrey.

Keeping a pond from becoming sta

(Kenneth Blundell).—A free circulat
the water is the best means of overc
this trouble, and if you could increas
inlet and outlet you would soon obse
improvement. Apart from this we kn
no other method of destroying Flannel
other than by the use of sulphate of c
This would neither destroy the Water
or any fish other than trout. $2\frac{1}{2}$ o
copper sulphate is sufficient for 10,000
of water, and should be drawn throu
latter in a muslin bag until dissolved
have no knowledge of the water wee
refer to.

Callirhoe digitata

(R. S.).—Mostly natives of North Am
the Poppy Mallows are perennial in c
ter, although often treated as half
annuals. C. digitata grows about 2
high, producing numerous Popp
magenta flowers about $1\frac{1}{2}$ inches a
shading to greenish-white towards the
each one branching out on a long, s
stalk, the foliage being light and deepl
The seeds should be sown in pans of
soil in March and raised in a temperat
55 degs. to 60 degs., transplanting the
seedlings in the open in April, or they m
sown outdoors in April. Ordinary ligh
soil suits them best. So far we have

The First Roses of 1929

E system of pruning one-third of each sh or Rose tree early, one-third mid-ason, and one-third late, as advocated ge 159 of the issue of March 9th, has ollowed here. The dry, hard winter ted not only root development, but the es from hydrating a sufficiency of de-es or sap, and at pruning time it was see which shoots were likely to start quickly and which would be backward, t it was not difficult to prune to the tions given in March. As soon as the rost had melted oil completely, od soaking of was given in to wash and out all the ous matter in il, which work e naturally in a l season by rains. This ng helped the es to make sap e buds to plump The usual thin-ut was carried rly in May, and rst Rose cut ay 31st. The eek in June a r were cut, the and third weeks ne early Roses r zenith. Sixty were out on 9th, 100 on the 5 on the 21st, on the 22nd; from 80 bushes ndards. So far 400 Roses, with r 300 visible, will be spread he next fort- and another ll later, is the

This is an average of over 10 Roses ant, spread over from May 31st to ly. Many of the buds of the second s are well advanced, and by mid-July be in full flower, so that there will break in the continuity of bloom hout the whole season. The results have been particularly good. Con-g that only 25 Roses were planted last the spring, and that the majority eeled in in November, 1927, in sixes ees together, grown like that through nd only planted out in March and 929, with the exception of a few new standards and bushes, the results are remarkable. Coming from a strong clay soil to a light, sandy loam which cannot stand a drought, it just shows how accommodating the Rose is. The singles had the buds disbudded to one only, and Isabel and K. of K. have been superb. Mrs. Henry Morse, with Mrs. Chas. Lamplough, have been huge and lovely, nearly 6 inches across. Golden Emblem has been large and grand. Augustus Hartmann, Château de Clos Vougeot, large and wonderful in colour, Florence Izzard and Mabel Morse very good and with deep colour, Dame Edith Helen superb, Shot Silk small, but the plants are very small and weak. They are gaining strength now. The General has been a marvel, 18 large, fine, beautifully shaped and coloured blooms from one bush. The first six spread over a week, the next six blooms all out together, now at their best, with six more to flower within the next 10 days. The old favourite, George Dickson, has never been quite so fine, huge in size, grandly shaped, and superb colour, vivid blood-crimson, with not a vestige of bluing. Mrs. H. Stevens very beautiful, Marcia Stanhope not yet in flower, Betty Uprichard moderate, Alexander Emsley wonderful, Los Angeles and Independence Day good, Lady Hillingdon rather pale, weak plants, now getting strong. Of the new standards, Etoile de Hollande has been grand and huge. What a glorious deep tone of colour. Geo. Howarth fair only; as a maiden it was too grossly grown. Julia Countess of Dartrey has so far given two good blooms and two more are to come, all from three bushes, two of which outrival Geo. Dickson in robustness of growth. One bush is 6½ feet high, the other 5 feet high and 5 feet broad, a mass of strong growth and wonderful foliage, though well thinned out in May, and very few flowers. Will more develop later? And will the laterals give autumn blooms? With new Roses only experience and time can answer the questions. So easy to grow, but how to cover with blooms it still remains to find out.

C. A. JARDINE.

Rose Elisa Robichon

Notes of the Week

Flowers and gardens at the 1930 Stockholm Exhibition

A WEALTH of flowers, such as has never before been seen in Sweden, and a large number of model gardens will form prominent features of the big Stockholm Exhibition of arts, crafts, and ideal homes to be opened in May, 1930. Practically all leading garden experts of Sweden will exhibit, and many have begun their preparations more than a year ahead. The architects of the Exhibition have at their disposal what is said to be the most picturesque site ever occupied by a display of this kind—a beautiful bay with wooded shores within the precincts of Djurgaarden, the ancient royal deer park of Stockholm, a district formerly belonging to the domains of the Swedish kings.

This Exhibition, which will be Sweden's

predominant attraction in 1930, is already arousing widespread interest abroad. A number of conducted tours from various countries are being organised, and the Stockholm hotels, which are preparing to meet a big international invasion, have already received reservations for visitors from abroad.

Omphalodes cappadocica

O. cappadocica will grow almost anywhere in partial shade and in a nice friable mixture of loam and leaf-soil. It is not, admittedly, so dazzlingly lovely as O. Luciliæ, but it is sweetly pretty—a charming arrangement of loosely set sprays of Forget-me-not flowers, less than 12 inches high, and appearing in spring. It is a fine plant for colonising on the shaded parts of the rock garden or in a shady border. Ralph E. Arnold.

Staking

This is important where quantities of Peas and Beans are grown, and should be carried out before the former reach 8 inches in height, otherwise squatting will take place. In the case of Runner Beans it is advisable to tie up the shoots at first where they do not take kindly to the stakes. All must be abundantly supplied with moisture and an occasional watering, with stimulants, will prove beneficial to heavy laden rows of Peas. Damping overhead is of immense benefit if carried out during the evening.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

A proposed Rock Garden Society

In view of the suggestion made by Sir William Lawrence, in the issue of June 22nd, that a Society be formed in connection with rock gardening, and in view of the caustic remarks of "S. I. B." concerning rock gardens at Chelsea (page 444 in issue of June 29th), a revival of the rock garden controversy may be expected. In such a case may I, too, offer a few remarks upon the subject from the point of view of the ordinary, everyday, all-round gardener, who is responsible for supplies of fruit, of flowers, of pot plants, of vegetables, and for the upkeep of lawns, tennis courts, croquet greens, shrubberies, and grounds, with, in most cases, a strictly limited number of helpers? The rock garden, when all is said and done, may not incorrectly be described as the hobby of the specialist or of the dilettante. In either case it is the be-all and end-all; other work must be subordinated to its requirements—and they are not few. Admittedly one of the most pleasing forms of gardening, the rock garden has assumed proportions altogether beyond its definite value; it has caused more controversy and more heated discussion than even the historic case of Rosa laxa as a stock! With the dilettante I am not greatly concerned. For him the rock garden is a toy, or a solace for spare hours. With the specialist, or quasi-specialist, the case is different. To be effective a rock garden must be of considerable area, and, as all of us well know, some of us to our sorrow, the work is never-ending. Unfortunately, even the specialist is, as a rule, none too keen to provide the needful labour. To maintain even a moderately-sized rock garden in anything like decent —not to say perfect—order where other work must be carried on is no easy task and, at times, leads to rawness of temper and of discouragement to the person who, after all, is ultimately responsible for its upkeep and who has to shoulder the blame for inevitable failures.

I have, particularly, in mind a very elaborate rock garden which was, some years ago, made in the West of Scotland by a leading English exponent of this type of work, and at vast expense. When it was finished it was handed over to the gardener as a "going concern," but without any augmentation of his not too large staff. Last year I saw it, and to my gratification a prophecy I ventured to make when I saw it fresh from the needle had been fulfilled. The more robust plants—the "weed-hiders"—had been encouraged at the expense of the choicer subjects, which had practically disappeared—Rock Roses, Barberries, Thymes, Potentillas, Veronicas, Phloxes, Sedums, Gypsophilas, Pinks, and so forth were in great and unkempt drifts, and the early promise had disappeared for ever. Well do I know that other gardeners can give similar instances. Fired by the "Chelsea rock gardens," many owners of gardens, smitten by the fashionable fever (who will dispute that, at the moment, the rock garden is "fashionable"?), have embarked on rock gardening without at all realising to what they have committed themselves—and to what they have committed their unfortunate gardeners harassed by a multiplicity of other work. I have known instances in which a gardener has been told that the rock garden will entail no extra work upon him. "We are going to look after it ourselves." That means, of course, until the novelty has worn off—until the weeds, spent blooms, and deaths begin to be troublesome. The beginning of the end is then at hand. "We are going from

land, New Zealand.

Seakale

ERE are two plants of noble aspect ose common use is to provide for the chen, and whose fine qualities as gar- ants have, therefore, been generally ked. Many a time friends have said: t is that splendid, great, silvery " not recognising it as the kitchen Artichoke. Another equally de- plant is the ordinary Seakale. In a way we do not see the plant at all, is either under a big Seakale pot or away in some dark corner of a green- for forcing. But occasionally a root t singly in garden ground and grows ouched from year to year. When in ddle of June it is in full bloom, there no doubt as to its merit. On a well- hed plant the mass of creamy bloom as much as 3 feet across, rising from eaves of the noblest aspect, some of 8 inches long by a foot wide, with an dge that is toothed in detail but has sculpture-like ways of folding and , and have a quite remarkable blue- s colour. The flower has a sweet ke honey—not honey pure, but honey with wax. As with many others of e family (Wallflowers) to which it be- it has the delicate honey scent on the and a heavier cruciferous scent below. such strong isolated plants as the one ted occur in gardens it may be worth ing that the quite young bud masses are a good table vegetable. In the the small fluffy mass of bloom just the Seakale is London Pride. G. J.

Multiple flowered Tulips

notes appearing in your recent issues subject of multiple-flowered Tulips are, , of more than passing interest.

variety Mon. S. Mottett has, of course, the market for a number of years. urprised that your correspondent has n able to trace it, "except in a few catalogues," as it is listed by most firms of repute. Your correspondent's y to find the record of the variety is, , the criterion of the popularity of or varieties of this form. The ques- are such forms desirable? Or are s an older generation of florists would id) "Monstrous"?

time to time, as varieties of flowers s, curious forms are produced, as, for e, double forms of Tulips and ls, and in another sphere Digitalis osum. It seems to be that the beauty of the Foxglove lies in its graceful hanging bells, and is in no way enhanced by the campanulate top. It is a matter of opinion whether there is any artistic beauty in double Tulips. Sir Daniel Hall, in his admirable book on the subject, sums them up in two words—"better dead."

The same considerations apply to branching Tulips. Have they sufficient merit beyond the mere fact of curiosity to warrant the perpetuation of the species? During the present year branching Tulips have been noted in several parts of the country. Among my own stocks I have had several with two, three, and four flowers, but I have particularly noticed that the stems appear to be semi-fasciated, and the grace, poise, as well as the intrinsic merit of each blossom suffers in consequence. I am informed that a Dutch bulb cultivator in Holland has selected and segregated a considerable number of these varieties in various colours, and that they will shortly be placed upon the market. They are liable to meet with a mixed reception, but it seems probable that they will in the main find buyers, if any, among amateurs who do not differentiate in forms worthy of cultivation between that which is beautiful and that which is merely curious.

The branching form is, of course, natural to certain species of Tulips, notably præstans, so that it would appear evident that it is a trait of character which could, without serious difficulty, be introduced as a feature of garden Tulips if desired. The whole question is, is it desirable?

HERBERT G. LONGFORD.

Abingdon, Berks.

Wool shoddy

I was much interested some months ago seeing a short article in your paper on the advantage of forking into a flower garden "wool shoddy" where the ground was very dry.

I tried it in very sandy soil, with the result that this long drought has had no influence on the flower garden, everything is growing normally, and where we dig up a plant the soil is quite damp.

We have no water supply, and I can only regret I did not get a larger quantity and dig some in the whole garden. L. S. M.

Primula pulverulenta, Bartley Strain

It may interest Mr. Dalrymple and other recent correspondents on this subject to know that, in this fearfully exposed place, this was the only Primula of any description to succumb to the prolonged frost of January, February, and March.

In previous years a certain percentage of plants have always failed to stand the winter, but this time we have not a single plant left.

The suggestion that stagnation of the roots is a probable cause is very much beside the point in our case, in view of the fact that the gravel subsoil everywhere here ensures complete drainage wherever the plants may be put. Moreover, knowing this Primula's dislike of such stagnant conditions, we have always taken special care on the point and grown it in situations much drier and more freely drained than would be usual, even in a district normally so wet in winter as this.

Having regard to its behaviour in previous years and its complete failure this time, I am now fully convinced that the hardiness of this Primula is very doubtful as compared with that of 50 others taken at random.

Skipton, Yorks. J. R. K.

Seakale in flower

The Caucasian Scabious and varieties

The Caucasian Scabious (Scabiosa caucasica) has always been a favourite among the hardy border flowers. Introduced at the beginning of the nineteenth century, its popularity has been consistent throughout. It is doubtless the best and most useful of the perennial species, either for borders or for cutting purposes. Its beautiful, fine heads of pale blue or lavender coloured flowers, produced on long, graceful stems, characterise it as one of the most ornamental subjects for indoor decoration.

Many of the newer varieties of Scabiosa caucasica, evolved and put into commerce in recent years, are of outstanding merit, and whether grown for garden adornment or for supplying material for indoor decoration their value cannot be over estimated. The increased range of colours is no less remarkable, and it is now possible to make a selection varying from almost pure white, through numerous shades of lavender, lilac, mauve, blue, violet, etc. To enumerate a list of varieties is only to make a catalogue of names. Mention, however, may be made of two or three of dissimilar colour: Miss Willmott is a splendid creamy white variety, and probably the best white to date; Diamond, of an intense blue, a beautiful flower and very striking; and Clive Greaves, with flowers of a rich violet mauve, deepening with age.

Where large quantities of flowers are in great demand for indoor decoration, these Scabiosas supply the need over a long season, blooming profusely from early summer to late autumn. In such cases, it is certainly advisable to cultivate beds of plants specially for this purpose in quantities proportionate to the requirements of the place. Well-grown plants will produce flowers with stems 2 feet to 3 feet long, and flower heads 3 inches to 4 inches in diameter.

These Scabiosas appreciate a good, deep, well-drained soil, plenty of lime, and should be given an open situation. On cold, heavy, clay soils they are not long-lived plants. In order to perpetuate the different forms and varieties, propagation is carried out by division of the plants in autumn or spring. As they continue to bloom late in the season, probably this operation is best undertaken in the spring, especially in the less favoured districts. Plants may also be raised from seed sown in the spring, and treated in the same manner as other hardy perennials. There are now many good strains on the market which may be relied upon to produce flowers of excellent quality. If, however, one desires to save seed from home-grown plants, this should be collected from the best flowers which have been left to ripen seed, due regard being given to colour and form.

J. L.

Indoor fruit notes

NOW that there is work for every hour in the garden, fruit under glass is liable to suffer neglect, resulting in failings later on. As new roots are commencing to work freely, sufficient water must be supplied, for once let them have dry soil to contend with and the ends soon die, with the result that something very soon goes wrong above ground. It may be Peaches will drop too freely at the stoning stage. Grapes may have more withered berries than they should have, quite spoiling the shape of the bunches. This is all due to a check in their career. Such a state of things must be avoided by timely waterings, and if done thoroughly, no more is needed for a week or 10 days. At this season well-drained borders will take a good amount of water, which should be varied with liquid manure, or a good fertiliser applied and watered in.

During summer, ventilation plays a most important part in the welfare of fruits under glass. There can be no hard and fast rules, as the weather greatly influences the operation. Whenever the conditions are seasonable, one rule may be adhered to, and that is to leave just a chink of air on at night. There will be no scalding of fruit and foliage if this is done, resulting from a hot burst of sun on moisture-laden foliage and fruit in tightly closed houses. Without unduly lowering the temperature or causing excessive draughts, admit air freely during the day.

In close, stuffy houses trees will become over-luxuriant, but unfortunately they do not show it at once, as many plants do, but wait until autumn, when, instead of that brown, hard wood we so much wish to see, we find it is straw colour, and the leaves look as if they will remain on all the winter. Growth of this description is quite useless for fruiting, and the only way to prevent it is to study the ventilation. Then, again, a good deal of the success with indoor fruit growing is the keeping down of insect pests. The two worst pests are Red Spider and Thrips, which usually arise through too dry an atmosphere, and although there are several good remedies on the market, there is nothing like prevention. If a certain degree of atmospheric moisture is maintained, these pests cannot thrive, and this is created by damping down paths and bare parts, leaving them always moist. This may necessitate several visits a day in hot weather with syringe or can, but it is well worth the trouble. Most growers have experienced attacks of that loathsome pest, the Mealy Bug, which may be destroyed with a small brush and methylated spirit.

To prevent mildew, good culture is required and careful ventilation, avoiding a cold, stagnant atmosphere, draughts, and overcrowding of growths. A dusting of flowers of sulphur if given directly the first signs are observed will often prevent a serious attack.

The matter of over-cropping must be guarded against, Peaches resenting it above all fruits. To secure the best fruits, allow one to every square foot of space. With Vines, if well established, the rods will carry 18 or 20 bunches and finish them off nicely, but if 10 more bunches were retained it would probably mean very inferior results.

One must also realise that the thinning of fruit is an investment for another year; that is to say, the shoots not bearing are building up reserves that with reasonable care will produce the very finest results. Overcrowding also must be looked to. In the case of Peaches, retain only sufficient wood to be trained in easily, as a rule no more than three shoots on any one bearing fruit, one at the base, one in the centre, and a terminal. Pinch Vine laterals two leaves beyond the bunch, and those not bearing fruit at the fifth leaf. Stop all sub-laterals at the first leaf.

F. H.

Summer pruning

There is a systematic and discriminating type practised by good gardeners for many years which seems to me to practically embody the so-called Lorette system. Valuable contributions on the subject have often appeared in GARDENING ILLUSTRATED, but as the season for the work will soon be approaching a few hints may not be out of place. Firstly, avoid too early curtailment, especially on strong-growing trees, or the result will be only a crop of worthless back growth. An examination of the wood towards the base of shoots will indicate the approach of the ripening stage. Trees which in the majority of seasons crop heavily, as, for instance, Early Prolific in Plums and Beurré Alexandre Lucas in Pears, make comparatively little growth, which ripens quickly, and they may be among the first to receive treatment. The trees should, however, be gone through carefully, especially the cordons, bushes, and pyramids, to note the crop and the growth made and (if not already realised) the characteristic growth of different varieties. I do not think we take sufficient
of this, *i.e.*, that while the shoots
variety may at the end of June be gre
rather on the soft side, those of anoth
thin, wiry, and fairly hard, and it is the
that can always be taken in hand f
our summer pruning operations. Na
in seasons when the crop is scanty
will be extra strong, and work on suc
delayed until the wood shows signs of
ing. The same remarks apply to
Gooseberries and Currants, which req
little special attention or the removal o
mer growth.

Meconopsis Baileyi

THE interesting correspondence o
beautiful species, and the metho
culture mentioned, tempts me to w
word of warning to enthusiastic growe
to fuss their plants unduly, for it may
to their undoing. Meconopsis betoni
(Baileyi) is perfectly hardy in any part
British Isles, therefore it requires no
protection, and it resents coddling in
form. Mulches of lawn mowings, as r
mended by "H. J. H.," are rather da
ous owing to their heating properties, a
use of leaves as a winter protection is
likely to be detrimental than beneficia
it will tend to hold excessive moisture
the crowns, and will probably provide a
fortable winter home for the voracious
where he can satiate himself unseen. O
other hand, leaf-soil should be freely
into the soil, for it is the natural food
woodland plants.

The cultural requirements of Mecon
Baileyi are comparatively simple. The
may be sown as soon as they are rip
kept until the following spring. If the
sown in autumn it is advisable to sow
so thinly that the young seedlings ma
main in the seed-pans during the winter
be pricked out in the early spring.

A good compost on which to sow the
and for growing on the seedlings consis
leaf-mould four parts, loam two parts, c
silver sand one to one-and-a-half p
according to the heaviness of the loam.

The young seedlings should be grow
a cool house or frame during the w
months, with good ventilation at all t
They should be pricked out in spring in a
of similar compost in a cold frame, and sh
be shaded from bright sun. When l
enough the seedlings may be transferre
their flowering quarters, the best pos
usually being a half-shaded border out of
drip of trees.

It is not advisable to grow plants
Meconopsis Baileyi in pots at any stag
their growth, for a pot-grown specime
generally a weak one, with few flowers o
whereas a well-grown plant will produ
strong spike of from eight to 12 flowers
first year of flowering, followed by
stronger spikes the second year, with f
12 to 18 flowers, whilst each plant will a
age four flower spikes.

Lavender

Its cultivation for marketing and distilling

LAVENDER has been grown commercially in the south of England for a great many years, having been introduced in 1568, and where the soil and situation are favourable, there is no doubt that it is a profitable crop and worthy of consideration. Lavender is grown for the production of oil of Lavender for perfumery purposes, for sale in a fresh state as "bunched Lavender," and for sale as "dried Lavender" for sachet making, etc. As regards oil production it is pointed out that chemistry has not yet succeeded in producing a synthetic product which can claim to be a substitute for English Oil of Lavender, and hence the supply depends wholly upon the natural product. The variety grown, and which should be grown commercially in England is Lavendula vera, usually referred to as "English" Lavender, of which several strains exist. The chief Lavender growing districts in the past have been in the neighbourhood of Mitcham, Hitchin, Canterbury, and Bournemouth, the Mitcham oil of Lavender having become world famous as a product unequalled by that of any other country.

SOIL AND SITUATION.—Too much stress cannot be laid on the importance of soil and situation. These are the factors governing success, and should be carefully considered before steps are taken to plant any large area. In common with all plants containing a high percentage of oily matter, Lavender needs very little moisture and does best in a calcareous, stony, well-drained soil in dry, sunny situations. The ideal soil is a light brown loam overlying chalk, although sandy loams may be utilised, provided good dressings of chalk or lime are applied. Heavy soils which hold water are not suitable.

Situation is quite as important as the soil, if not more so, as Lavender is by nature a sub-tropical plant, although fond of high altitudes. It is liable to injury by frost, and hence low-lying situations and those prone to become weather-bound in winter should be avoided. Even under favourable conditions in England, a hard winter may result in a number of plants being killed by frost. The situation should be exposed and sunny, preferably sloping to the south, and protected from the prevailing summer winds by a belt of trees or a high hedge. This matter of protection is important, as considerable damage may be done by high winds when the tall flower spikes are being carried by the plants during July and August.

PREPARATION AND CULTIVATION OF THE LAND.—It is supremely important that the land be properly prepared by deep and thorough cultivation. Potatoes which have been well manured make an excellent forecrop, as the thorough working of the land will prepare the way for the Lavender.

After planting, it is essential to keep the land in a thorough state of cultivation while the plants occupy it, in order to secure a good annual throw of bloom. A horse-hoe should be used for this purpose, and the land worked both ways and as close to the plants as possible.

PLANTS AND PLANTING.—The plan most favoured, after a supply of plants is secured, is to plant them out 18 inches x 18 inches very carefully on the square. When these plants have occupied the ground for one year, each intervening plant, and those of every other row, are taken out, leaving the land planted 36 inches x 36 inches. The plants so removed will be utilised for planting up fresh ground, each being divided into about three. Before being planted the plants should be trimmed at the top and the rough roots removed to where the fibrous roots have developed. The usual practice is to use a straight chopper and clean wood block for preparing the plants for re-planting.

Planting should be done in October or early spring. November and the winter months should be avoided, as the plants are then liable to injury by frost and snow when out of the ground. It is important to plant very deeply. Special dibbers not less than 14 inches long are used, and the plants should go into the ground up to within 2 inches of the top and be very firmly closed in.

In commercial practice the bushes are seldom retained after their fifth year, after which they should be grubbed and burnt. It follows, therefore, that in order to keep up a continuous supply of bushes in their prime, planting and grubbing must, in an *established* plantation, be done every year. Most growers plant, in the first instance, a fifth portion of the ultimate area of Lavender aimed at, and this is repeated each year until the fifth year, when the area first planted is grubbed immediately after flowering and the land fallowed. It is an advantage to have a sixth piece of land available for planting in the fifth year in order to give the land, which has carried Lavender for five years, one complete year's rest from the crop. During the first year in the permanent position the plants are better for not being allowed to flower, but should be kept trimmed with a pair of sheep shears to promote bushiness.

Fifty Years Ago

Living copings for walls

THERE is one kind of coping for walls that is not used so much in small gardens as it might be with advantage—viz., living copings of Ivy, Roses, Virginian Creepers, Jasmines, Clematises, etc. At first sight it might seem that few of these plants, unless it were the Ivy, had sufficient density of foliage to afford much protection to the trees below, but it is quite otherwise. I have observed a crop of Peaches saved year after year by the protecting power of a few sprays of a Virginian creeper. It is a simple matter to run a few wires on studs projecting a foot or so from the wall immediately under the coping, and to clothe these wires with climbing plants, thus crowning the wall with verdure and beauty, and saving our fruit crops by one and the same process. Fancy a coping of Marechal Niel—one of the best Roses possible for this purpose, owing to its free growth and early leafage and flowering — surmounting a wall studded with Peaches underneath. Living protectors have, at least, this merit above all others—they would be cheap at first cost, durable, efficient, and assuredly beautiful.

MARKETING THE CROP.—The Laven
ready for market when the middle bl
of the spike are widely open; the lowe
soms will then be fertilised and t
blossoms showing the bloom of th
When sold as bunched fresh Lavend
stalks must be cut as long as possibl
ting well into the bush (this is also s
the purpose of cutting back the bush
operation). The cutting is done by a
sickle having a toothed edge, and sho
done as late in the evening as is com
with despatch for market. Bunches fo
ket are about 12 inches in diameter, tie
raffia as low as possible to the butts.
these bunches are tied together in bu

When sold as dried Lavender the f
are dried on the stalk and are subseq
removed by hand or with the aid of a
There is a considerable loss of weight
the drying process, and only about a f
the weight of fresh flowers will be av
as the dried product. The Laven
dried by being spread out thinly on s
in a dry shed for about six weeks.

DISTILLING.—The founding of a La
plantation for the purpose of oil prod
is an enterprise which requires carefu
sideration beforehand. It will be nec
to provide a small distilling plant o
grower's premises, unless arrangement
be made for the distillation of his crop
local distillery. If the grower possess
distilling plant of his own, he cart
Lavender to a neighbouring still,
intends the boiling, and watches fo
"oil-run."

Beyond reference to the facts that th
should be of the shallow body type a
worked by steam from a boiler, the tech
of distilling cannot be discussed here.

When cutting for distilling, the b
must all be fully out, generally about a
later than for market. The cutting s
only be done in the sunshine, the cut la
clean, dry mats, and covered from sun s
immediately. There must be no moistu
the stook, neither must it be dried up by
or sun. The mats will be rolled up i
cool of the evening, before the dew is fa
and carted to the still. The flowers mu
placed in the still in a perfectly fresh
dition.

For some purposes the stalks are
ened to about 6 in. before stilling,
generally the whole of the contents o
mat are placed carefully in the still
away.

The yield of oil is apt to vary conside
from season to season, as the age o
bushes and the weather will affect bot
quantity and quality of the product.

Roughly speaking, 1 cwt. of fresh flo
with 6 inches of stalk will yield about
of oil. An acre of Lavender in its
would, in a favourable year, yield from
20 lb. of oil; but, taking the whole o
area planted as directed above, an ave
yield of 12 lb. to the acre would be a
estimate. The market value of the
constantly fluctuating, and its use in
fumery is influenced considerably by the
of alcohol. It is a noteworthy fact
English oil of Lavender enjoys a very
higher value than imported oils.

After distillation the oil is matured i
dark, for from three to five years, store
blue glass jars known as "Winchest
holding about 80 oz., but as this is us
done by the merchants it does not co
the grower, unless he elects to store
mature his own oil.

LAVENDER DISEASE AND PESTS.—Lave
is, unfortunately, often severely attacke
this country by a fungus disease know
"shab" or "wilt," which is caused b

s *Phoma lavendulae*. The disease ilting or shrivelling of the growths, nes attacked soon die.

isease is under investigation at the time, and at the moment little can efinitely as to preventive measures. ould be taken to obtain healthy r planting, and if the disease appears lantation all affected portions of nd dead bushes should be removed t as soon as detected.

dly drained soils, and soils with a of lime or chalk, the roots of the e often attacked by the mycelium of which penetrates to the main stems ately causes their death.

act nature of this disease is obscure, pears to depend very largely on soil s, and is not very troublesome where r are favourable to the Lavender.

sect or other pests are known to avender to any extent, but slugs use damage by eating away the rowths in the early summer.

al work in the flower garden

of us who have to rely on hardy nd annuals for our summer display tle facility for artificial watering omewhat despairingly at our plants the close of the long drought, but the rain pulled them round wonderfully, one has to be busy. One of the is to put some stout twigs round the of the old Clove Carnations to hold ower-stems, which are pushing along the same time prick up the ground round them to receive the prepared which to layer. Another favourite require a little support is the double aved Campanula.

s of stronger-growing flowers, like kets, will generally come through although even in their case a few light Pea-sticks so placed as to be practically out of sight may prove useful. I have sown a pinch of seed of different-coloured Cornflowers this year in the neighbourhood of clumps of herbaceous members of the family, and the association will be pleasing and give many different shades. All the members of the Marigold family, from the lofty Calendula to the lowly Tagetes, make a brave show and are very enduring. Where only a few annuals are required to fill vacant spaces it is best to rely on things of an enduring nature that will last out until the end of the season, such as the pink and white Lavatera and Nemesia Blue Gem.

One likes to have occasionally some plant quite different to anything else, even if neither showy nor beautiful, and I have one at present in Euphorbia pilosa, some 3 feet high, with fine heads of its peculiar flowers. It is more attractive than the great scarlet Poppies, which are just making their appearance, so we are getting a variety of colour, for the buds of Geranium grandiflorum are on the point of bursting and the Rockets are still at their best.

E. BURRELL.

Didiscus cœruleus

Helen's glen

Helen has a garden, a charming garden, looking over hills and woods, very pleasant to the eye. But Helen has gardeners, and she proposes, and they dispose. But one day she woke up and said, "I want a garden of my very own, where I can do exactly as I like."

Now the garden proper ended in a narrow ditch that gently and very straightly drained away any possible water from the higher ground into the wood below, and one passed over it every time one went to the tennis courts, and sentinel over it, in stately fashion, were some noble old Oak trees. "Here," one day said her friend, "is your new garden. Widen it irregularly, plant it with Primulas, Iris, Spiræa, Cape Lilies, Senecio, Saxifrage, and a thousand other lovely things. In the winter you turn the water off into this other little channel, and your Kæmpferi will flourish accordingly."

Helen did this, and much more besides, and the result is a truly beautiful piece of gardening that I have never seen excelled. It has the advantage of perfect setting, the sparse trees above, the wood below, and beyond the blue, misty outline of the downs. The ditch, a wave of colour, falls away from your eye into this wood, where Lilies sweeten the air and Azaleas make a Chinese fairy tale. Group after group of Primulas fill the widened space, Helodoxa and Bartell's Strain, Bulliana, and japonica. The Siberian Iris in blue, violet, white, and yellow is flung among them, and marvellous to see, because I never associated them with damp, great Mulleins are making much ado, their grey, spreading leaves charming among the pink, rose, and yellow. Later come the Kæmpferi, Mimulus, and Spiræa. Phlox, which dearly love their toes in the water, find a place, and later still the Cape Lily's coral and pink show themselves among the fading joys, though latest of all, the blue Pea, revelling in the damp, carpets the ground with heaven's own hue, and the autumn Crocus bears it company.

From earliest spring, when the Daffies light up the close-cropped turf on either side the shallow ditch, it is a garden of delight, and it is a form of gardening that many other lovers of flowers growing beautifully could emulate more often with much joyful recompense to themselves.

Maude Haworth-Booth.

Lilies now in flower

I AM writing from a garden in S.W. England, a very old garden, practically on a level with the river, which flows unceasingly not many yards distant from an old-established clump of Lilium Martagon catanæ. The deep, purplish claret flowers of this Lily, without any spots, are seen to advantage close to a planting of the true L. colchicum, whose pendulous, bell-shaped flowers of rich buttercup yellow pervade the air with their fragrance. The bulbs of this Lily were only planted last autumn, but quite 50 per cent. are flowering profusely.

Near by are a few fine heads of the true szovitzianum. There is do doubt whatever that although in the past L. szovitzianum has been sold for L. colchicum, and vice versa, they are quite distinct one from the other. The pale, straw yellow of szovitzianum, with its pronounced petal tips of purple, when seen growing by the side of L. colchicum, does not need a horticultural expert to note the distinct difference of colour. I do not know any other Lily with such glorious rich yellow flowers as the true L. colchicum.

No doubt the cool subsoil where these particular Lilies are growing is to some extent responsible for their healthy appearance, and being only a few yards from the river they are not feeling the effects of the drought.

A large clump of L. croceum in another part of the garden is just coming into flower. This old-fashioned Orange Lily when left for years is really marvellous, and proves that if Lilies are to be seen at their best they must remain undisturbed. Some of the heads are nearly 4 feet from the ground, and in a few days will be a wonderful sight.

The new forms of umbellatum have been very gay for the last fortnight. A number are still thick with flowers. Golden Fleece is a grand addition to the umbellatum section, its large, broad-petalled flowers of golden yellow, tinged with orange and scarlet, is a splendid break from the old grandiflorum type. Orange King is another variety worthy of note. The spreading flowers made up with shapely petals of deep orange, with effective scarlet tips, are very striking. Apricot I do not think is likely to impress the Lily enthusiast. The colour tone is certainly all that the name implies, but the habit and general appearance of this variety is particularly disappointing, and I shall certainly discard it or place it in some secluded spot. Splendidum, with its large heads of dull crimson, is a fine plant, and although when viewed in conjunction with Vermilion brilliant it appears to lose its colour, it is of splendid habit, and probably the strongest of all the umbellatum Lilies. Vermilion brilliant is wonderful. The massive broad petals of the deepest vivid blood-red, with just a few spots of black, are of the right shape and colour to place this variety as the finest of the more recent introductions. The old grandiflorum and incomparabile varieties are making a wonderful splash of colour, but there is no doubt that the new forms of umbellatum are distinct improvements and worthy of a place in all gardens.

All the above-mentioned Lilies are growing in a soil containing a certain amount of chalk. Not that I advocate chalk, except in the case of L. candidum, but the natural soil here happens to contain a certain amount. Previous to planting, a good deal of leaf-mould, collected from the surrounding woods, mostly Beech, was incorporated, and the bulbs enveloped in sand. Whether any special compost was used when the old clumps were planted, I cannot say. In the planting of the more recent introductions I have always made a point of seeing that drainage was good, in my opinion an all-important point in the successful cultivation of Lilies.

Liliaceæ.

Fancy-leaved Pelargoniums

IT was not on account of their blossoms that tricoloured Geraniums were valued so much as their beautiful foliage, and to use a common expression much in vogue in my youth by those who grew them, " their leaves are the flowers "; indeed, I have a distinct recollection of my father pinching off flower buds as they appeared in order to concentrate the energies of his favourites in the production of more wood, and incidentally in obtaining more highly coloured leaves on his plants. Why did fancy-leaved Pelargoniums lose their popularity, and is it possible to resuscitate interest in them, are questions worth considering in these days. In the first place, the bedding-out mania, as it came to be called, involved considerable expense not only for those who were not possessors of greenhouses, but also in the case of those who raised their own plants, and after all, the display out-of-doors was but fleeting—a few months at the most—and then there was all the labour of propagating, lifting for potting of plants that had been turned out, and housing them for the winter under genial conditions. Interest in the culture of Geraniums for bedding perceptibly flagged, and not merely Zonals came under the ban, but the tricolours—the fancy-leaved kinds. Another thing which militated against the fancies was their comparatively slow growth.

To mention some of the varieties we used to grow 50 years or more ago is akin to perusing a number of choice old volumes in a library, or being shown wonderful specimens of Sheraton or Chippendale furniture. Here are some of the varieties that come to my mind, as I recall how carefully they were " tallied " in an old lean-to greenhouse: Mrs. Pollock held for a time chief place as the most highly coloured tricolour. It had a yellowish ground, suffused with carmine and red and brown. Mrs. Harry Cox was an advance on the first named, being more pronounced in colour, and, what was more important, was robust in growth in comparison; Macbeth, another of the golden tricolours, had a deep carmine zone. Black Douglas and Marechal MacMahon were two noted for distinct bronzy centres with margins of yellow. Then there were Lady Cullum and Sophia Dumaresque, which also were beautiful in their golden and reddish coloured leaves. Silver tricolours were a most interesting class, and were, I think, rather more free in growth than the golden. One recollects such varieties as Prince Silverwings having a whitish ground and marked with green and pinkish tint, and Mrs. Laing of similar colourings. Others that were very popular in their day for bedding were the yellow leaved Crystal Palace Gem, Beauty of Lauderdale, and Golden Chain, th with a crimped edging of yellow.

Some time ago in looking over an o logue issued in the early 'seventies, than 60 varieties of gold and sil coloured Pelargoniums were shown, gives an idea as to how popular th become! The question is sometime as to whether it is likely that a revi ever take place in these once highly e members of the Geranium family. Th have not all died out I am convinced it were possible to make a tour of we should, I think, find some of the mentioned still grown. I have a rea making this statement, as no less rece last summer a gardener, writing to the subject of old Geraniums, sai know their worth from a bedding p view, and before the War I had thousand. I used to grow Mrs. Hen which, to my mind, is the best of and Mrs. Pollock, Flower of Sprin Fairy Queen. When in the army th was lost, and the place keeps changing and, of course, taste and fashion char

We live in days when it is the fas specialise certain plants and to foste wider culture and make them more p associations have been formed with view. One has but to mention Swee Roses, and Dahlias to explain what is But the Geranium, one of the olde assuredly one of the most widely plants, to be found in many a cottag dow, has not, so far as I can rememb this distinction conferred on it.

It is singular, to say the least a plant which is found everywhere have been allowed to become depleted of its sections—the tricoloured, and not unimportant one—and those to w have mentioned the matter agree in that many of the beautiful varieties of years have been lost, much to their The question I would like to see an is the one asked at the beginning: interest in them ever be revived? " W

Eranthemum pulchellum

This beautiful Acanthad, with brig flowers produced in profusion, is a v plant for winter decoration, and well- pots of it make an attractive variation embellishment of the winter garden servatory at a time of the year wher flowering subjects are few.

A native of the East Indies, it is a house plant, but after it has been gr flowering stage, it stands quite well in a lower temperature and remains decorat a considerable time. Large specimens plant make handsome objects, but for decorative purposes smaller plants, from cuttings struck in April or Ma grown on into 6-inch pots, are much useful. The cuttings strike readily u bell-glass in a warm house, and it is to strike them singly in thumb pots they may be potted on without root d ance. They like a rich soil, and a c made up of two parts loam and on rotten manure, with sufficient coarse s keep it porous, suits them admirably.

The essential conditions of cultivati quick and clean growth are strong abundance of water, and atmospheric ture during the growing season. Shad be necessary during the hottest part day, but should not be overdone, as ex to light induces sturdy growth and f free flowering. When well establish their flowering pots, periodical applic of dilute liquid manure may be given the flowers appear, when they may moved to cooler and somewhat drier tions.

Maples

a large group of European, Ameri-
Japanese trees, represented in this
by the Sycamore Maple (Acer
lantanus) and A. campestre, which
us in its many forms for our gar-
he Maples are mostly medium-sized
rdy in nearly every garden soil.
warf-growing Japanese Maple, A.
n and its varieties, are exceptions
e, and very useful plants for small
or rock gardens. They are among the most beautiful of summer leafing shrubs, giving fine effect of foliage and picturesque habit. This section have a flat, horizontal spreading system of branching, a characteristic of many trees and shrubs from Japan. There is nothing in the open garden so charming as good plants in full leaf, with their branches in table-like tiers, but the brilliant tints always seem more effective in the subdued light of shady rocks, and happily few shrubs do better in partial shade than the above. They like shelter even from southerly winds, and they will thrive in any open soil.

Libocedrus decurrens

They are good subjects for planting in close proximity to water. In common with others of its kind, these shrubs do not need to be planted so that their roots are in the water, but rather on a somewhat elevated position, pinched between two rocks, and one that is near to the margins of pools. All the summer the shoots will be covered with brilliant foliage, and when this departs the glowing red bark will give a touch of brightness during the dreary season.

A. dissectum is a dwarf shrub, with bright green finely cut leaves. It exhibits a loose, round form. A. d. atropurpureum is similar to the above in habit, and only differs from it in having highly coloured leaves. A. d. ornatum is a dark form with a neat spreading habit. A. d. palmatifidum has green leaves very finely cut.

H. Stevens.

Tree Pæonies

The beautiful modern varieties of Tree Pæonies are to be found in fewer gardens than their merits deserve. Large, old bushes of the typical Pæonia Moutan are fairly often seen, but the somewhat unpleasant scent of their magenta flowers has prevented the plant from ever becoming a popular garden favourite. Many of the modern varieties are of extremely beautiful colouring and nicely scented. Continental hybridists have produced a race of very large, fully double flowers, which lack the grace of the single and semi-double varieties of Japanese origin. Some desirable Japanese varieties are: Fuji-no-mine (pure white with golden stamens), Kokirin (rose-pink, very free flowering), Saigyo-Zakura (pale pink), Kokirin-Nishiki (deep crimson), Ruriban (rosy-purple), Kasumi-no-mori (white), Azuma-Kagami (bright scarlet), Hana-no-tsukasa (flesh-pink, deepening at the base), and Fuyo-ko (salmon-pink). These have all flowered exceptionally well here this year in spite of the unusually severe frost. Fortunately they had not started into active growth before the frost commenced, consequently the buds were uninjured. A mild winter followed by late frosts is the worst enemy to Tree Pæonies. They thrive in any good garden soil which will grow herbaceous Pæonies, but appreciate an annual mulch of well-rotted manure. As the choice varieties are always grafted, it is important to see that the stock does not overpower the scion. They are sometimes grafted on P. Moutan stock and sometimes on P. sinensis, the herbaceous Pæony; the latter will generally be found the more satisfactory, as if suckers make their appearance they are easily detected and removed. Whatever the stock, fairly deep planting is advisable, as after a few years the scion will make good roots of its own.

A novel roof garden

It is a sign of the times that great business houses are identifying themselves with the growing popularity of flowers and gardens among the general public. At the Oxford Street store of Messrs. Selfridge's is now to be seen a roof, unique of its kind. Set right in the heart of the Metropolis, 180 feet above the most famous thoroughfare in the world, is a garden as restful and charming as any that can be found. Motives, other than altruistic, inspired its planning; the idea was conceived in a desire to assist members of the amateur gardening public in the choice of garden features.

Extending uninterruptedly for a distance of more than 200 yards, a series of gardens, each complete in itself, has been designed for the purpose of assisting and further developing the art and love of gardening. Here there are lawns and water pools, flowers and foliage, plants to clothe the heavy structure of oak pergolas and sun coves, and in quiet relief are old world pigeons, quaint cotes, sandstone walls, and heavy paving in random style.

Among the thousands of daily visitors are gardeners who marvel at so daring an experiment, wondering how this and that amongst the plants will fare when winter comes.

As many readers know, Bouverie House, the home of Gardening Illustrated, and situated in the heart of the Press world, has a flourishing greenhouse on the roof, which is managed by an enthusiastic committee.

Attend to Dahlias

These are making rapid growth now, so thinning of the shoots should have attention, while tying to the stakes must not be neglected, or the wind will in all likelihood cause serious damage. The Dahlia quickly resents dryness at the roots, so should the weather continue dry give a thorough soaking of clean water, while the following day a further drenching of weak liquid manure will prove beneficial.

The Dry Weather

THE British Rainfall Organisation, Meteorological Office, Air Ministry, have sent us the map reproduced on this page, together with the following details:—

The scarcity of rain this year has become a matter of general interest, and in many parts of the country water engineers are anxious as to the adequacy of their supplies. Not since 1921 has there occurred such a pronounced shortage of rain; indeed, the intervening years have been marked by excessive rainfall, the excess being usually well distributed throughout the year.

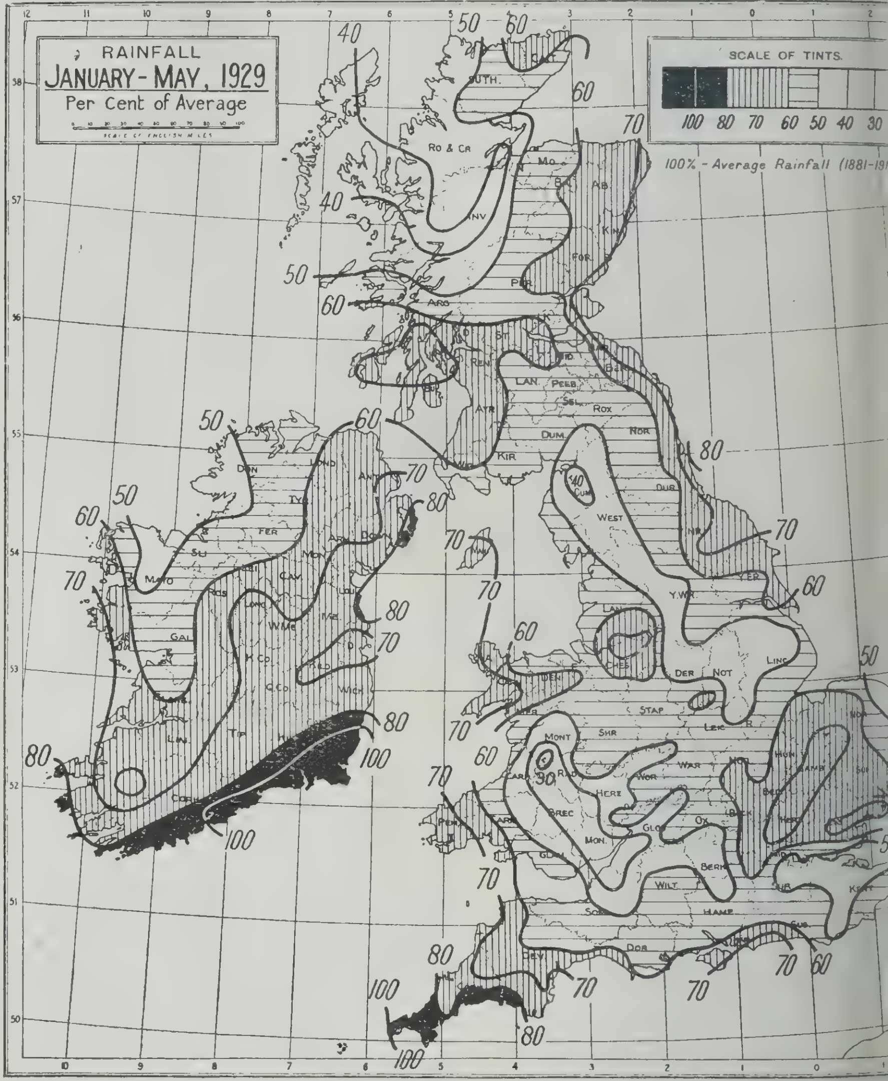
The period of relative dryness commenced generally in December last, and it continued in most districts until May. The following table shows the general rainfall of the last six months. The values in the table are not actual rainfall amounts, but they are rainfall amounts expressed as percentages of the averages. This method of expression is adopted in order that the values may indicate at once the relative degree of dryness (100 per cent. denoting an average fall, 50 per cent. half an average fall, and so on).

—	1928.	1929.				
	Dec.	Jan.	Feb.	Mar.	Apr.	May.
England and Wales	83	71	49	13	57	103
Scotland	96	49	54	24	76	107
Ireland	96	57	129	24	51	109
British Isles ..	92	63	67	18	61	105

From the point of view of water supply the important feature of this table is the fact that the three winter months, December to February, showed a decided deficiency, and that the following month, March, with 18 per cent., gave the lowest monthly percentage general fall on record for the whole of the British Isles. For it is the rainfall of the winter months which percolates through the soil and maintains our springs and rivers. Summer rainfall, unless exceptionally heavy or continuous, is absorbed by vegetation or evaporated again, and does not contribute much to water supplies.

The percentage values given in the table above are general values for each country as a whole, and in order to show the variations in different parts the accompanying map has been prepared from the records of nearly 300 stations distributed over the British Isles. For each station the total rainfall from January 1st to May 31st, 1929, was expressed as a percentage of the average rainfall at that station for the same five months, the averages being derived from records of the 35 years, 1881-1915. The percentage values were then plotted on a map and lines drawn to indicate where the five months' rainfall was 30, 40, 50, 60, 70, 80, or 100 per cent. of the average. The 100 per cent. line indicates areas where the fall just attained the average. This line is drawn in the middle of black patches extending from 80 per cent. upwards, and it occurs only in the extreme south of Ireland and the extreme south-west of Cornwall. Areas with less than 50 per cent. of the average fall in the five months, January to May, are left unshaded. They occur in the north of Scotland, the north of England, in the Midlands of England, and the contiguous parts of Wales, in Kent, and in N.W. Ireland. London and Birmingham received about half their normal rainfall amounts, Edinburgh and Glasgow had about 55 per cent., and Dublin about 60 per cent. The lowest percentage values so far worked out are 30 per cent. at Llangurig (Montgomery), 35 per cent. at Rhayader (Radnor), 36 per cent. at Margate (Kent), 39 per cent. at Aspatria (Cumberland), and 38 per cent. at Fort Augustus (Inverness) and Bendamph (Ross). The highest percentage value is 119 per cent. at Waterford.

Only 2·72 inches of rain fell at Margate during the five months, and 2·86 inches at Shoeburyness (Essex). At Seathwaite, the wet spot in Borrowdale (Cumberland), 24·15 inches were measured, this, however, being only 47 per cent. of the average value of 51·09 inches for the five months, 25·78 inches (73 per cent. of the average) were measured at Blaenau Festiniog, in North Wales, and 24·72 inches in the mountains of Connemara.



[*Reproduced by permission of the Air Min*

Most of the rainfall observations upon which this note is based were contributed to the Meteorological Office by voluntary observers in all parts of the country, whose assistance is gratefully acknowledged.

The Horned Poppy

Some of the readers of GARDENING ILLUSTRATED who are taking their holidays by the sea may meet the Horned Poppy growing (with almost miraculous thriftiness) in the shingle of the foreshore. Good gardeners will be content to admire it under the conditions that best show off its beauty, and it is to be hoped that others will resist all temptation to dig it up. There are good and obvious
reasons for leaving it to flower for
light of other eyes, and, if they are r
cient, it should be borne in mind t

REMINDERS FOR THE WEEK

thern and Midland

flowering Begonias

ally those of the Gloire de Lor- ｏe, should now be growing freely, hile a brisk, moist temperature able to maintain the plants in and healthy condition, an occa- imulant will prove beneficial. Keep s near to the glass, shading the latter he hottest part of the day. Shift on ts into larger pots as required, and all flower buds as they appear. A stakes will be necessary to support st plants, and where it is the custom hese splendid winter flowering sub- furnishing hanging baskets no time lost in getting these made up. The eatment will be found very satisfac- most of the winter flowering kinds.

ens

should now be occupying cool and shaded frames, where growth is both nd clean; dryness at the root is a itation to attacks of mite and thrips. e avoid this at all costs by intelligent , spraying, and shading from bright . On warm, settled nights the lights h advantage, be removed altogether.

ous Calceolarias

fine plants enjoy very similar con- o that recommended for Cyclamen, om bright sunshine being most im- with an abundance of moisture round eir receptacles, but the plants them- ust be watered with care, especially age.

as and Primulas

nditions are necessary here also, and is more suitable than the cold frame accommodation. Once past the stage, the former grow rapidly, and ive a check if permitted to become . Therefore shift the plants on into ts before this condition arises. A my soil, to which has been added of leaf mould, sharp sand, and a e-meal, will suit both species.

al flowering Carnations

he exception of those brought along to produce flowers under glass dur- er, all should now be in the open air, will admit of a thorough cleansing igating of the houses. No time lost in placing plants required for wering in their final pots, and until part of this month all growth show- lency to push flower spikes should be lown. Avoid attacks of Red Spider p by syringing the plants freely fol- t days, but should these pests gain a pinch of common salt to a gallon of ayed upon all parts of the plant will heir damaging the foliage.

les which may be sown now

vacant plots where early Potatoes, tuce, etc., have been growing become at this date, and may be turned to e if dug and manured at once. ts may be sown with Onions, Beet, summer Cabbage, Cauliflower, early of Peas, French Beans, Spinach, of which will prove of inestimable supplying small sweet and tender arly autumn. One important point orne in mind when planning for this ply, and that is, that all the crops thinned, not transplanted, and per- mature in the lines in which they were sown. Transplanting would in most instances check the plants and prevent their maturity.

Netting fruits

Bush and other fruits must be netted, otherwise the greater part of the crop will be lost. I find it necessary to use $\frac{3}{4}$-inch mesh netting, otherwise the most elegant of our singers can pass through easily and do quite a lot of damage; also, since nets have become so expensive, I use wire netting 2 feet wide all around the base, and thus the fish netting is kept clear of the ground and its life extended considerably.

The flower garden

This is now very gay, and every effort must be made to keep Roses clean by spraying, climbers trained, old flowers constantly removed, and staking wherever necessary. Whether the plants are large or small, this is equally important. The hoe must be constantly going, in order to present the beds and borders in their most interesting and beautiful condition, and this can only be attained by cleanliness, judicious watering, and removal of discoloured blooms as they appear.

Herbaceous borders

On sandy soils watering is constant, but must be done, or the result will be quantities of naked stems before summer has reached its zenith. Staking, too, is claiming a good deal of attention.

Polyanthuses

Sown during April in pans are ready for pricking out at 4 inches apart in the open to provide good roots for autumn planting.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Arabis albida fl. pl.

This is one of the easiest of plants to cultivate, and yet many growers lose it, from one cause or another. It is easily raised from cuttings, and these, if secured now and dibbled into a bed of sandy soil, well watered and carefully shaded from all sunshine, will be ready for planting in their permanent quarters in a few weeks' time. In combination with some of the dwarf Brooms, it is very telling on large rockeries.

Aubrietias

The Rock Cresses are among our most cheerful, early-flowering dwarf plants. They are much more difficult to root than are the Arabises, but if secured, while the growths are comparatively soft, shortly after flowering is finished, they are more likely to do well than when left until later. Insert carefully in well-drained boxes, filled with very sandy compost. Set in a sheltered and shady place until rooted.

Garden Pinks

When cuttings are taken late in the season, they often fail to root; so it is advisable to secure them about this time. Good results often follow when shortish shoots are pulled off with a heel and planted firmly on a shady border, without any trimming off of leaves. Merely take out a notch with a spade, run a little sand or sandy compost into the bottom, set the bases of the cuttings on this, fill in the soil, and make very firm. Ordinary cuttings can be inserted in boxes of light soil and set in a shady frame.

Stake border Chrysanthemums

If stakes have not already been placed to these plants, it will be necessary to do this now, without further delay, for when once the stems get bent over for want of suitable support it is never possible to get them into good upright condition again. Where the shoots are at all crowded, remove all the weaker ones, for overcrowding is bad for the plants. If Green Fly are present in the points spray with some good insecticide.

Spring Cabbages

It is only by having the plants of good size before winter sets in that really early Cabbages can be produced. It is necessary therefore to sow the seeds in good time. In our later northern districts the first week in July is none too early, while in the more favoured localities about the 21st will be found to give good results. "Velocity" I find a very valuable little Cabbage, coming into use a week or 10 days before Flower of Spring and Milecross Marrow, all three being very hardy, of fine table quality, and non-bolters.

Spring Broccoli

If planted at once there is still time for these to succeed. Very firm, and not over-rich ground is necessary if this crop is to stand the winter, for it is only by encouraging the plants to make firm, sturdy growth that they will be able to withstand the vagaries of our climate.

Lettuces for autumn

It is hardly worth while to sow after this date here in the north, unless a frame can be used when necessary to protect the plants. For present sowing I find Ben Lomond, New York Giant, and Webb's Wonderful very reliable and of fine quality.

Turnips

Continue to thin earlier sowings, as they become fit, while a final sowing of both white and yellow varieties should be made so as to ensure fresh young bulbs, until frost spoils them. Chirk Castle, Black Stone, although anything but attractive to look at, is of quite good quality, and is very hardy, even withstanding all ordinary winters out-of-doors.

Onions

Do not fail to water this crop copiously during dry weather. An occasional soaking of liquid manure also will help materially in swelling up the bulbs, while frequent dustings of soot will help to discourage the dreaded grub and also stimulate the plants. Failing a supply of liquid manure, an occasional light dressing of some good artificial manure will be very good for the Onion crop.

Dwarf Beans

These useful subjects are very frequently considerably spoiled by reason of over-crowding of the plants. Where there is any evidence of this it is very easy to put matters right by thinning down to 9 inches or 12 inches apart in the rows.

Tomatoes

Plants carrying good crops of fruit require to be well nourished, so systematic feeding must be carried out. Liquid manure should be given weak and often, while if this material is difficult to procure a light dressing of some good chemical fertiliser will do at least equally well, being well watered in. Care must be taken to prevent a close, stuffy atmosphere in the house, a little air being left on, even during the night.

C. BLAIR.

Preston House Gardens, Linlithgow.

"The Scientific Papers of William Bateson" *

SCIENCE in England has been singularly fortunate, alike in those who have fostered its progress by actual effort and in those who have supplied for that progress the complementary necessity of money. The munificence of the wealthy English gentleman has frequently given to the brilliant man of science the opportunity for which he might have had to wait years longer if he had had to rely on public bodies. Of this we are reminded by the recent publication of the scientific papers and of the popular addresses of one of the most brilliant scientists of our own time—those of the late William Bateson. These volumes contain nearly all Bateson's contributions to the scientific and popular literature of his day, and the "scientific papers" embody the results of Bateson's scientific investigations, and their importance makes of them a lasting monument to the memory of this "heaven-sent genius."

The consummation of Bateson's life work, however, was aided considerably by the generosity of a wealthy gentleman who had carried on business in the City towards the earlier part of last century. John Innes was a wealthy City merchant who bought an estate in the area that is now known as Merton. At his death he left the estate, together with a considerable sum of money, both to be used for founding a school for gardeners. The endowment became so large that it was deemed sufficient for founding a Horticultural Research Institution, which later became known as the John Innes Horticultural Institution. In due course the post of Director was offered to William Bateson, who then held a Professorship in Biology at Cambridge. His acceptance was conditional upon the reservation "that he should be allowed space on the land to run his poultry and continue his breeding experiments with them. . . . Happily, permission was granted." In the memoir which is published along with Bateson's popular essays and addresses Mrs. Bateson describes the condition of the site of the future Institution as Bateson termed it, "The land which the experimental garden at Merton was to occupy was bare, and, but for crops of Mint for Mitcham Salteries, practically uncultivated." Such were the beginnings of what was to become one of the most famous research stations in the world.

Notwithstanding his predominantly zoological interests Bateson, during the time that he was Director of the John Innes Horticultural Institution, commenced and carried to a successful conclusion many investigations of a horticultural nature. The results of these investigations form the subjects of several of the articles which are now included in "The Scientific Papers of William Bateson." The horticulturist who recognises the importance of the scientific foundations of his subject will be interested in such papers, among others, as "On the Genetics of Rogues Among Culinary Peas," "Root Cuttings, Chimæras, and Sports," and "Genetics in Primula sinensis." In addition to such papers, which embody the results of Bateson's own researches, the collection also includes Bateson's contributions to several discussions with many eminent men of his day. Of these, perhaps, one of the most interesting from a horticultural point of view is that which centred round the origin of the cultivated Cineraria.

The late Sir W. Thyselten-Dyer, himself an eminent horticulturist, exhibited at a meeting of the Royal Society early in 1895 a specimen of Cineraria cruenta, from the Canary Islands, side by side with a plant of the common cultivated form, and in connection with this he stated, "that, firstly, of the two forms exhibited the one had been produced from the other; secondly, as far as is known, the process of evolution had been accomplished by the gradual accumulation of small variations and not by the selection of sports or seedlings, presenting notable and striking variations."

Bateson dissented from this view on the grounds that "records of the early culture of the Cineraria" indicated "(1) that the modern Cineraria arose as a hybrid derived from several very distinct species; (2) that the hybrid seedlings were, from the first, highly variable; (3) that sports of an extreme kind appeared after hybridisation in the early years of the improvement of these plants; (4) that the subsequent perfection of the form, size and habit has proceeded by a slow process of selection." The species that he mentions as having contributed towards the hybrid are cruenta, aurita, populifolia, and lanata, all from the Canary Islands or

Madeira. Bateson elaborated his a
in a series of letters which appe
Nature in 1895.

The collection of Bateson's more
addresses and essays includes one or
prints from the Journal of the Roya
cultural Society.

Time has altered but little the
these pieces to the horticulturist. T
ject matter is still a potential sourc
rivalled interest, and the method of p
tion recalls most forcibly the passa
the memoir that each lecture "was
lously thought out."

In such papers as those we have me
above the horticulturist will doubtl
his main interest, but the other art
these volumes command attention,
because, in so far as they all deal w
problems of heredity they may hav
bearing on problems of horticultural i
but also because "an exact determina
the laws of heredity will probably wor
change in men's outlook on the wo
in his power over Nature than an
advance in natural knowledge that
foreseen."

cones should always be sent.

FLOWER GARDEN

Plants for fragrance

(A. J. W.).—This is not a very suitable time for starting to raise plants of any kind, but for out-of-doors, at the proper season, you could plant Lily of the Valley, Wallflowers (you could procure plants of these shortly), Auriculas, Roses, Pinks, Carnations, Woodruff, Monarda, Lavender, Liliums of sorts, Tree Lupins, Stocks, Nicotiana, Polyanthus, Mignonette, Thyme, Violets. For the greenhouse you could have Heliotrope, Cytisus, scented-leaved Pelargoniums, Carnations, scented Verbena, Mignonette, Liliums, Cyclamens, Primula malacoides, P. Kewensis, Roses, Polyanthus, Narcissus, Hyacinths, Jonquils, Freesias, double Wallflowers, and Stocks.

Narcissus Tazetta, an early flowering form from Portugal

I have seen in your issue of March 9th a photograph (page 158) of early Narcissus "collected in the hills of Portugal." Can you give me information as to where in Portugal this comes from? Is this a popular flower, *i.e.*, is there any demand for the bulb?

J. K. CASSELS.

242, Rua da Agra,
Foz, Oporto, Portugal.

[We are unable to say in what district this Narcissus was found, but of its popularity there can be no doubt. If you are in a position to collect bulbs, you would gather all the information you desire by corresponding with one of the principal English or Dutch bulb growers, such as Messrs. R. H. Bath, Ltd., Floral Farms, Wisbech, Lincs., or Messrs. Van Tubergen, Haarlem, Holland.]

Name of plant

(Capt. Henry L. Cochrane).—From the description you give of your plant we should say that it was either Heuchera Richardsoni
or H. tiarelloides. The flowers of the
possess no colour beauty, but bear a g
aspect when grown in numbers. This
however, is grown for its handsome

Iris diseased

(R. F. S.).—There are two serious diseases of Flag Iris, one a Leaf Spot, the second a Soft Rot, which affects the rhizomes. The organism causing Soft Rot has from time to time received different names, and one name under which it has been known was Pseudomonas. It may be that actually there is more than one organism which causes the rot. However, they have one thing in common, *i.e.*, they are all bacteria and, as such, flourish in an alkaline medium. There are many people who, like yourself, give a dressing of lime to plants affected with Soft Rot, with the result that the disease spreads very rapidly. The lime has probably no effect on the cell sap, but it makes the soil alkaline. The soil around plants affected with Soft Rot becomes highly infected with the bacterium, and the disease spreads through the soil. A dressing of superphosphate of lime tends to reduce the bacterial activity. If you follow out the directions upon the control of Soft Rot which have been given within these pages of late you should have no difficulty in obtaining control. Sterilisation in some form or the other is essential.

Plant to name and culture of same

(Clipstone).—The plant is Veronica parviflora (Bowles hybrid). Plant in a warm and sheltered border or other sunny spot where it is protected from cutting winds, and in well-drained loamy soil containing a portion of leaf-mould. As your soil is on the heavy side we advise you to introduce a little coarse sand or gravel into it to assist aeration. You should then experience no difficulty in growing this pretty plant.

Columbine Leaf Miner

(L. B., Ohio).—Your specimen leaf duly arrived, but did not contain any specimens of the insect which causes the damage, therefore we are unable to state the actual causal organism. There are many dipterous flies which cause similar damage in many plants in England, and we think your damage is caused in the same way. Here we use nicotine as a control for Leaf Miners. Prof. Theobald has shown that a very strong solution of nicotine will kill the larvæ of some Leaf Miners within the leaf, but his recipe is expensive, working out at about the rate of 8 ozs. nicotine to 10 gallons of water. You might try the effect of using an ordinary application of nicotine solution as follows:—Nicotine, 1 oz.; soft-soap, ½ lb.; water, 10 gallons. Increase the amount of nicotine if you find the above not strong enough to kill, but be careful not to use the material strong enough to burn the foliage.

Rasphail semi-double Geranium

(Little Welshman).—Both Dobbie and Co., Ltd., The Scottish Seed Establishment, Edinburgh, and John Forbes (Hawick), Ltd., Buccleuch Nurseries, Hawick, Scotland, catalogue the Zonal Pelargonium (Geranium) F. V. Rasphail.

GREENHOUSE

Cycas revoluta

(Seven Rides).—Your plant is a Cycas revoluta and is one of the most valuable of the greenhouse plants that may be placed in the open air from the end of May till October. It should be put in a warm, sheltered position. As a greenhouse plant it will thrive in turfy loam and coarse sand. The pot must be well drained to prevent stagnation. Young plants can be obtained from suckers, which are occasionally thrown up. We certainly advise repotting; in fact, this might be done each year. It should be kept in a moderately moist condition. Probably your best plan now would be to get a local florist to plunge it in a greenhouse hotbed to develop new growth quickly.

Begonia Rex turning brown

(Begonia).—Mix up a little soot and lime into a paste and place this in a pail of water. When thoroughly dissolved submerge the pots in it for a few minutes and water in future with a tablespoonful of lime and soot to 2 gallons of water.

Celosia failure

I am enclosing three specimens of Celosias and will be greatly indebted if you will state cause or reason of their obvious check. One specimen has roots attached, but the majority of the batch were potted into 7-inch pots and possess healthier roots than the specimen enclosed, yet all, numbering five dozen, are affected as the enclosed, and therefore suspect some overhead trouble. A. R. L.

[We have examined your specimens and can find nothing present that indicates the cause of the trouble. The roots are in perfect condition, and it is only the youngest portions of the aerial parts that are affected. It appears to us that the damage has been caused by insecticide or fumigant of some kind. The trouble is certainly an overhead one, but what has actually caused it we are unable to state from the evidence we have. Perhaps you will be able to find out what has happened. Something has come in contact with the tender portions of the foliage which has burnt it.]

Hæmanthus Katherinæ

(R. Smith).—The Hæmanthus is by no means common in British gardens. Its culture somewhat resembles that of the Amaryllis, and is briefly this. Good, sound loam and fibrous peat, with enough sharp sand to ensure porosity. The bulbs should, unlike those of the Amaryllis, be covered with the compost. A temperature ranging from 50 degrees to 60 degrees suits them while making their growth, but the flowers last longer if the plants are removed to a cooler house just as they open. After the flowers fade the plants should again be moved to their former quarters, and after full growth has been made, much less water and a lower temperature should again be provided so that the bulbs may secure a rest. The plants must not be placed in large pots, as it is only when well pot-bound that flowers appear. They should be left in the same pots for several years.

Carnation Leaf Spot

(F. E. Sowden).—The specimen Carnation foliage sent for examination is affected with Carnation Leaf Spot, which is caused by the fungus Septoria dianthi. This fungus causes a lot of trouble to Carnation growers, and, once it becomes firmly established, is difficult to control. Spores are produced from all the affected portions; these are carried into new areas by air currents and by water, when the plants are syringed. The best control measure is to pick off and burn all the affected portions. This can sometimes be done not by removing the entire leaf, but only the affected tip. Of course, if the whole leaf is affected it must come off. The plants should be sprayed at intervals of a few days with a solution of liver of sulphur 1 oz. to 2 gallons of water. Repeat the picking off and spraying until you have obtained control. Do not syringe for a time, but to guard against Red Spider you must keep the plants well damped down. Please note that we do not reply through the post.

TREES AND SHRUBS

Yew hedge

(New Reader).—In the first place you were much too late in planting your Yews, and, secondly, wild plants lifted as described are always very doubtful unless quite small. When grown and prepared in nurseries, such bushes are transplanted every second or third year, and when finally lifted for transit receive very little check. We advise you to reduce all your plants to 2 feet, cutting the tops away completely, and prune all side branches to within a few inches of the main stem. This seems drastic treatment, but it pays in the end. Place a mulch of litter over their roots and damp the plants overhead in the evening following hot days. The reason that a few survived is probably due to none of their large roots having been broken.]

Beech

(N. M.).—The plant was well supplied with fibrous roots, and if planted at the right time—between November and March—ought to have done all right, although the soil does look what the Scots call very "fuishinless" stuff. The Beech rather likes a little lime in the soil, and it may be that yours is entirely deficient in this constituent. A moderate amount of old mortar-rubble from a demolished building might conceivably help. The soil, being so light and open, should be trodden down very firmly over the roots, and while the Beech, as a rule, requires little in the way of manure, some well-rotted garden refuse would, we doubt not, also help to give the roots a start.

Fir Tree insects

(A. N. C., Torquay).—Your trees are affected with Pine-shoot Tortrix Moth, Retinia buoliana, Schiff. This is often a serious pest. The leading buds or whorl of buds are not arrested in their early stages and therefore all begin to grow. The central shoot is soon killed by the caterpillar attack. All the side shoots usually grow away, but are often deformed. The life-history is that the moth appears in July and eggs are laid at the tip of the shoot, and the caterpillars hatch in late summer. The young caterpillars gnaw the side of a shoot and this causes a flow of resin which covers the caterpillars over for the winter. In spring they wake up and commence to feed, causing the injuries such as you send. The caterpillars are fully fed in June and July. The pupation period lasts from 10 to 14 days. Little can be done to control this pest other than picking off the affected shoots and burning them. This, of course, is useless if the caterpillars are not *in situ*. In small trees search might be made in winter for the pest within their resin homes.

(N. Cowie).—The insect pest of Pinus insignis and P. sylvestris sent for examination is the one noted above.

Pruning shrubs

(A. M. H. Rogers).—(1) Buddleia Colvillei should be pruned immediately the flowers are over. The pruning consists of taking off the old flower-spikes, removing overcrowding and impoverished branches so as to admit light and air, and the reducing of growths which are inclined to push beyond their allotted space. This shrub must on no account be treated in the same way as is usual with the Chinese species. (2) Actinidia chinensis should be pruned only when absolutely necessary, and this should be done during the winter or towards the end of March, when just sufficient clean, strong growth should be left as will enable the leaves, etc., to develop to their full extent. This is now in bloom and making long growths, which may be pinched at their tips, or even removed altogether if there is no room for them to be trained in. It is a grand climber for a tree where it may ramble at will and prove very effective. The writer has seen it 80 feet high and spreading through the branches of a large Corsican Pine. (3) Ribes aureum.—A careful thinning of the branches should be made in October and any necessary shoots or branches removed to equalise the balance of the bushes. With young plants it is sometimes necessary to reduce the current season's growth to half its length in order to build up shapely bushes for future years.

Hole in tree

(J. S.).—Although the boring such as you mention is certainly not advisable in any tree, we do not consider that any harm will arise in the case of your Elm tree, especially as the hole is only to be driven half-way through

BEES

Moving Bees

Is it possible to shift bees and hives a distance of about 30 miles (in a car) in warm, sunny weather, and how should I set about it? L.

[Hives containing bees can be moved safely at the present time if due precautions are taken. The brood chamber must first be securely fixed to the floorboard by means of screws. The quilts must be removed, a wooden frame, about ½ inch deep, covered with perforated zinc at the upper side, the exact size of the top of the brood chamber, should be fixed at the top of the frames so that these latter are held firmly in position. This is very important. There should be no possible chance of these shifting during transit. In place of the entrance slides fix a strip of perforated zinc along the entrance of the brood chamber, and make sure that no bees can get out. The outer lifts and roof can be kept in place by being roped round, the ropes passing under the floorboard and over the roof. These operations should be performed in the evening after the bees have ceased flying for the day. The hive can then be moved to the new location. Bees dislike excessive vibration, so it will be well to drive slowly. Before liberating the bees, allow the hive to remain undisturbed for a quarter of an hour or so; this will permit them to settle down. Do not attempt to remove the frame of perforated zinc above the brood chamber until the following morning, but the quilts should be temporarily placed above it. It would be as well to place a handful or two of hay in front of the entrance when liberating. This will help the bees to mark their new position.—L. B.-W.]

FRUIT

Seedling Strawberry

I am sending a sample of Strawberries from plants which I have been cultivating for the last three years. I found the seedling growing wild among wild ones in a Cobnut plantation where Strawberries had not been grown, to my knowledge, for 50 years. The only varieties growing near are Sovereign and Paxton, which are about half a mile distant. It is a vigorous grower, a splendid cropper of medium-size fruit, commencing to ripen about June 18th and ending about July 12th. Practically free from disease. Is it a distinct variety? What is the cross? I should like your opinion of quality for commercial use.—KENT COBS.

[The fruits travel remarkably well, a most important point for a market variety. The flavour is good, and the fruits are of useful size, and of nice shape and appearance. The seedling is distinct from Royal Sovereign and Sir Joseph Paxton, both in fruit and
foliage. So far as we can tell, it is a
variety, but coming, as it does, from a
berry growing county, there is the po
that it may be a stray from a Str
plantation or the seed may have been
by birds or human agency. The seedl
nothing to do with the wild Straw
among which it was found growing,

and Pear questions

. W.).—(1) The Pear leaves sent for tion are affected with Pear Leaf Mite (Eriophyses pyri). This mite d breeds within the tissue of the during the summer. The adults e in the scales surrounding the buds winter. The best method of control ay the tree so soon as the leaves drop, solution of lime sulphur at winter . In mild cases this is usually suffi- control, but in bad cases, such as pears to be, it is necessary to repeat ying just before the buds begin to the spring. Rake up and burn as the affected leaves as possible after It may be necessary to repeat the several years before you obtain full No measure of control can be out during summer. Theobald, in periments at Wye, found that lime was more effective against this pest f caustic soda *plus* 1 lb. of soft-soap ded to each 10 gallons of lime sulphur (2) We have carefully examined imen Pear fruits and cannot find a which could possibly have caused the ation. It occurs to us that the real the trouble is at the root of the plant. y remove some of the soil and ex- e fibre roots, and we expect that you that they are dead. It is also likely 4 query is due to the same cause, there is no sign of a fungus present ecimen leaves. You will, of course, a position to consider what has the roots. Many things could have t, but it must have been something n character or the fruits would not eloped as they did, neither would the ave reached their present size and e off. Have you been using manures g? There is no sign of Red Spider in the specimens sent. (3) Your liage is affected with Capsid Bug, an hich causes much trouble on Apple and fruits. In appearance the Apple when adult is like a huge Green Fly but, unlike Aphis, the Capsid can rapidly. If the trees are jarred the creature drops to the ground fairly readily. The life-history is as follows:—Winter is passed in the egg stage and the eggs are more or less embedded in the bark of the tree. The eggs hatch during April and May, and at first are very small and have no wings, but at all stages the creatures run very rapidly. After several months the adult stage is reached, and as each moult occurs wings are gradually developed. Capsids feed by piercing the tissue of the host and sucking out the cell sap. A red mark occurs at each puncture. Eggs are laid in late summer, and in the case of the Apple Capsid the whole summer is spent on the Apple. Pears are occasionally used as a host. The best control is to spray about 10 days before the flowers open, using a good nicotine wash. Care must be used to drive the spray well into the flower and leaf trusses or little good will be done. The Capsids which fall to the ground must also be sprayed or they will ascend the trees and carry on. Nicotine is only a contact wash and must therefore hit to kill.

VEGETABLES

Tomato plants

(A. J. W.).—Your plants seem, judging by the leaves sent, to be in a weak condition. While your compost is good enough, as far as it goes, you would require (unless the loam is of extra fine quality) to enrich it with some good chemical fertiliser, Thomson's being one of the best for use in the cultivation of the Tomato. A good quantity of dry wood-ashes should also have been mixed with the soil at planting time. You can easily apply the fertiliser now, giving about a dessertspoonful to each plant, sprinkling it evenly all over the surface and covering with a little fresh soil mixed with wood-ashes. This should help to bring the plants into good health.

Asparagus

(Mrs. Eleanor Pain).—While there will be little difficulty as regards the two rows of seedlings, it will be somewhat difficult to make good the gaps in old beds from the thinnings from these, as the Asparagus is so easily damaged if you begin to dig among its roots, as you would obviously have to do in lifting some of the seedlings. It would really be better to well thin the seedlings, leaving them about 15 inches apart, and either buy sufficient plants to fill the gaps or else next spring sow seeds thinly in the gaps. Or better still, sow the seeds on well prepared ground in another part of the garden, the young plants from this sowing being transferred to the gaps a year later. We may say, however, that we do not greatly favour making up gaps in old beds, finding it much better to bring on young beds until in full bearing and then destroying the old ones.

Onions dying

(G. McKeown).—Your trouble is caused by the Onion Fly, and we advise you to pull up all affected plants and destroy them. If you squeeze the lower part of the plants you will see the maggots emerge. Dress your ground between the rows with either nitrate of soda or sulphate of ammonia at the rate of 1 oz. to each square yard, lightly hoeing it in. This will be very unpalatable to the maggot, and also act as a strong stimulant to the plant, promoting in it such vigour that it will quickly grow beyond the critical stage. Another method is to spray the young plants with a petroleum emulsion once each week, from mid-May to mid-July, using a wineglassful of paraffin to 1 gallon of water. The paraffin must be mixed with boiling water first.

MISCELLANEOUS

Dogs and cats

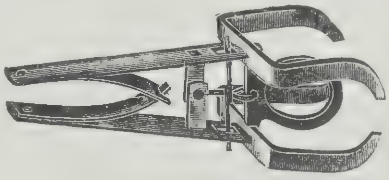
Can you give me the name of any material, powder or liquid, which has a smell which dogs and cats dislike? I have a bank at the end of the garden with wire-netting above, but some dogs manage to get in. An unpleasant odour might deter them.

C. A. W.

[We do not know of any liquid which can be depended upon to keep dogs and cats away from any given area, and we are publishing your letter in the hope that some of our readers may be able to assist you. In our own experience a generous supply of pepper sprinkled over the area acts as a deterrent to dogs and cats. Paraffin is also distasteful, especially to dogs.]

Trapping the common mole

(J. K. Cassels).—The best trap for this purpose is the one here shown. This consists of two small pieces of steel shaped like a two-tined fork with the tines at the base bent inwards. These are held together in the centre by a pin, which also holds the ring used when setting the trap. At the top of each fork handle, but riveted inside, are strong springs which close the trap as the mole approaches along its run and removes the ring, which has a hole in the centre large enough for the mole's head to pass through. This removed, the forked parts close up, gripping the mole round the body. Bits of poisoned meat placed in their runs will also get rid of moles. Any sundriesman would supply the traps.



Weed on small pond

(Mrs. C. D. H., Surrey).—This is the small pond weed, Potamogeton pusillus, a very troublesome weed once it becomes established. A close-toothed garden rake drawn through the water provides the best means of ridding one's pond of this nuisance. The rake should be pulled along the bottom of the water and thus prevent the plant from spreading and seeding. When broken through in this way collect the weeds from the surface and destroy them. Weeds growing among the plants must be removed by hand. If the collecting of the weed presents a difficulty you will find a fine-meshed sieve lashed to a long handle excellent for the purpose.

Daddy-long-legs

(A. M. A.).—The grub you send is that of the Daddy-long-legs. Give the ground a good dressing of lime or one of the many soil fumigants.

NAMES OF PLANTS

Alpine.—1, Rhododendron myrtifolium; 2 and 5, Rhododendron ferrugineum; 3, Rhododendron arbutifolium; 4, Rhododendron Kæmpferi; 6, Veronica buxifolia; 7, Geranium Lancastriense; 8, Geranium argenteum.

J. G. W., Near Frome.—1, Æsculus Hippocastanum (Horse Chestnut); 2, Acer negundo.

E. B. P.—1, Asperula cyanchica; 2,

Erodium Kolbiana; 3, Escallonia microphylla; 4, Linaria triornithophora; 5, Clinopodium calamintha.

Scot.—Cotoneaster microphylla.

Annie E. Lanyon.—1, Leptospermum scoparium Chapmannii; 2, Philadelphus Lemoinei; 3, Berberis Hookeri; 4, Pyracantha coccinea.

S. C. M., Gledstones.—1, Dianthus dependens; 2, D. deltoides; 3, D. superbus.

J. T., East Lothian.—Weigelia Eva Rathke.

Cæsar.—Chionanthus virginica (Fringe Tree).

C. Saunders.—1, Dictamnus fraxinella (Burning Bush); 2, Pulmonaria saccharata var. Mrs. Moon; 3, Asperula cyanchica; 4, Corydalis lutea.

Begonia.—1, Lantana odorata; 2, probably a Jasmine, but must have a flower with foliage.

H. Coleman, Manchester.—Bennets Seedling, a very old Rose.

"Lest we forget"

Mr. Lionel de Rothschild presided over a large and brilliant assembly at the Mayfair Hotel, Berkeley Square, on Wednesday, June 26th. The occasion was the 84th anniversary festival dinner of the Gardeners' Royal Benevolent Institution. Among those supporting the Chairman were:—The Lord Aldenham, Sir Jeremiah Coleman, Bt., J.P., D.L., V.M.H., Sir Frederick Green and Lady Green, Colonel Sir John Smith Young, C.V.O., G. W. E. Loder (President, Royal Horticultural Society), Mr. and Mrs. C. Grahame-White, Leonard Sutton, J P., C.B.E., Sir J. B. Slade and Lady Slade, Mr. and Mrs. John Weir, H. Gordon Selfridge, Capt. Noel Sutton, E. P. F. Sutton, R. C. B. Gardner, A. Simmonds, Mr. and Mrs. E. A. Ebblewhite, Lt.-Col. F. R. Durham and Mrs. Durham, Mr. and Mrs. W. L. Bradbury, Mr. and Mrs. Ernest Bigland, Mr. and Mrs. W. Cuthbertson, Mrs. J. W. Campbell, Mr. and Mrs. Edward Sherwood, and Mr. and Mrs. W. E. Marshall, of New York.

After the Royal toasts had been honoured, the Chairman delivered the toast of the evening, viz., "Continued Prosperity to the Gardeners' Royal Benevolent Institution." He touched upon the objects of this great Institution, which grants relief to aged and distressed gardeners and their wives. There were, he said, 26 applicants waiting on the list for election. He made a strong appeal for support for the fund, which, considering its good work, ought to be more flourishing and more widely known. Mr. Leonard Sutton, Chairman of the Committee, responded, and, in doing so, paid tribute to the Chairman and to his family, who had done so much for the Institution in the past. Mr. Leonard Sutton explained that there were now 265 pensioners on the list. The work of the fund is increasing, and there is greater need for it now than ever. Tributes were also paid to the late Lord Lambourne and to the late Mr. Peter M. Veitch, both of whom had done so much for the Institution.

The toast of "The Visitors" was proposed by Col. Sir John Smith Young, who referred to the human factor in gardens, to the trained eye necessary to keep gardens at their present high standard of efficiency, and to the influence of flowers, which turned the thoughts of men and women from grave to gay and from gay to illumination. He made a touching appeal on behalf of the Institution. The toast was responded to by Sir Jeremiah Coleman, and the toast of "Our Chairman" was fittingly proposed by Mr. Edward Sherwood (Treasurer, and Master of the Worshipful Company of Gardeners).

At the close of the evening the Secretary, Mr. George J. Ingram, announced the subscriptions that had been made in response to the appeal. These included 100 guineas from the Chairman; Mr. N. N. Rothschild, £100; Mr. Edward Sherwood, 100 guineas; Messrs. Sutton and Sons, £100; William Wood and Sons, £100; Royal Horticultural Society, 50 guineas; Mr. Gordon Selfridge, 50 guineas; handsome collections from Major E. Monro and Mr. J. Collingridge, of Covent Garden, making, with many other subscriptions, a total of £2500.

All desirous of supporting the Institution should communicate with the Secretary, Mr. George J. Ingram, 92, Victoria Street, S.W. 1.

The greenhouse White Fly

MANY people who have greenhouses find their plants troubled with this pest. There are several methods of dealing with it; the latest is that for killing it by means of parasites. The Empire Marketing Board and the Ministry of Agriculture, acting with the Experimental Research Station at Cheshunt in Hertfordshire, have arranged a plan for the distribution of a parasite which lays its eggs within the scales or egg houses of this fly and thus destroys the young stages of the pest. This parasite is entirely harmless to plants; indeed, it is dependent on the White Fly for its existence.

Where the White Fly is very numerous and immediate control is called for, growers would do best to start off with one of the older methods, and fumigate the greenhouses at night with sodium cyanide and sulphuric acid, which make up a deadly gas called hydrocyanic acid gas—*i.e.*, one-eighth of an ounce of cyanide dropped into a jar containing one-half of a fluid ounce of 33 per cent. sulphuric acid. That amount will deal with 1,000 cubic feet of space, and will kill the majority of adult flies without injuring the foliage, but it is a deadly poison to man and must be used with great caution. The other quick remedy by fumigation is 5 fluid ounces of tetrachlorethane to every 1,000 cubic feet of space. This volatile liquid is poured upon the path of the greenhouse. It is much less poisonous than hydrocyanic acid gas, and, therefore, much more suitable for use in amateurs' Tomato houses. The operator must not breathe the fumes more than is necessary, and on no account must stay in the greenhouse. The fumigant cannot, however, be used without injury to certain plants, such as Chrysanthemums, Fuchsias, and certain varieties of Pelargonium.

As regards the parasite, the method is slow but very sure. The parasite is a sort of wasp, known as the chalcid wasp, and the Research Station at Cheshunt will, so far as they can, supply it to owners of glasshouses and conservatories. Owners should write to the Entomologist of the Station, Cheshunt, Herts., stating the number of glasshouses and the type of plant which is infected by White Fly. Where it is a commercial nursery, in which blocks of houses are used, it is advisable to state the number of houses in each block. The size of the houses does not matter. The most suitable time for starting the parasite is from late March to early June, though it can be done up to the beginning of August. The Research Station will send full directions about it with each box of material. The wasps are quite small insects. The female has a pale yellow body, and usually is found on the underside of the top foliage of plants upon which White Fly is breeding. When the plant is touched, the wasp may jump like a flea, or turn to flying, when it will be seen to do so in a
manner. The male wasp has a da
and is only to be found when temp
in the greenhouses are low.

On receipt of the material from
search Station, the grower will at on
it in a shady place in the greenhouse
he knows the White Fly exist. From
three weeks after, at about 70
Fahrenheit, he will find little black
scales on the underside of the low f
his plants. If he does not, someth
have gone wrong, and he must

LATE REPLIES

Improving Anemones

(K. U.).—If it is possible the roots
be lifted at the present time and repla
once in freshly prepared ground whi
received a good dressing of leaf-mould
little bone-meal. If growing in gra
cannot do better than dress the surf
September with Peruvian guano at th
of 2 ozs. to each square yard, and ag
the end of March at the rate of 1 oz.
square yard. This should increase
vigour considerably.

Plum trees unhealthy

(A. M. N.).—The unhealthy look
foliage has been caused by the a
which, however, you have been able
stroy, so far as we can see. There a
traces of Silver Leaf, but we should
see some of the shoots later on, wh
will be able to say definitely wheth
disease is present.

How do you buy *your* BONEMEAL?

For immediate and complete assimilation by the roots of your flowers, fruit, and vegetable crops, you need a really pure bone meal; one guaranteed to contain no residue or added matter of any kind. Derrick's 100% pure bone is rich in phosphoric acid, phosphate, nitrogen, and lime; has all the constituents of a perfectly natural fertiliser, and no waste or slowly disintegrating matter Unequalled for all horticultural purposes.

15/- per cwt. *carriage paid*

A free sample will convince you. Write for it to-day.

INSECT BITES & STINGS
Absolutely Prevented

At last! Perfect protection against all insects under the sun. Just use Immurescine as a simple vanishing cream on all exposed parts—and Mosquitoes, Midges, Wasps, Flies, and other pests will leave you alone.

So effective that the strongest hive of bees can be safely manipulated without gloves.

Immurescine is the only anti-sting and bite preparation that both prevents and remedies. Little or no smell, pleasant to use, and a valuable skin food. Applied to any sting it prevents swelling and allays irritation at once.

e, deep yellow, verging on orange in the deeper parts, with an intensified Marechal Neil scent; Trigo, another somewhat similar, though paler in colour; Gladys Benskin, rose, flushed yellow, mainly at base; Elizabeth Arden, purest white; Night, almost black; Coquette, red, with yellow base, a lovely single Rose destined to be popular in every garden; Sally, a semi-single after the type of the Queen Alexandra Rose; Maid of Kent, an Ophelia-Mrs. W. G. Grant cross, a finely formed grand pink, most deliciously scented; Mrs. Johnstone, rose-pink, colour of Dame Edith Helen, with the form of Frau Karl Druschki; George Howarth, a large light crimson of good form and an excellent doer; Crimson Glow, a Hybrid Wichuraiana; and lastly, Peter Pan, for it is not possible to mention the very numerous delightful new Roses which cause the mouth to open and the heart to patter. In another page a full report will be found. Last year we drew the attention of our readers to the importance of the Chelsea Rose Show, and pointed out that a visit to the R.H.S. Chelsea Flower Show was not complete without a visit to the N.R.S. Chelsea Rose Show. Regardless of the fact that the week was one crowded with social events of great attraction, and exciting finishes fell on the Friday and Saturday, the N.R.S. Chelsea Rose Show drew a record attendance, in which figured guests from all the Dominions, from the Continent, and a record number

Rose Elizabeth Arden, awarded a Gold Medal at Chelsea
Shown by Geo. Prince

from the United States. To our American friends the Chelsea Rose Show is a delightfully startling reality, and something to talk about when they go home, which will not fail to raise the prestige of Britain in America. To our readers who follow the Rose we draw their attention to the Windsor Rose Show on Saturday, the 13th, in the heart of the Thames Valley, the chief centre of England where Roses do so exceedingly well.

NOTES OF THE WEEK

Horticultural Dinner

THE Government entertained last week the members of the International Professional Horticultural Federation, who are holding their Annual Conference in this country. In proposing the toast of "The Guests," the Right Hon. Noel Buxton, Minister of Agriculture, said the vital thing was to increase mutual understanding between peoples, and it was a happy thing that their Federation could be pioneers of peace while concerned with such a delightful subject as plants and flowers. He had himself been indebted to the international side of gardening, having learnt from the Japanese the idea of miniature landscape and practised the art in several places. Horticulture was also an instrument of social welfare. He was glad to know it was becoming increasingly a democratic institution. Till lately it had been somewhat plutocratic, but he had been greatly struck by the change in the gardens of the working classes both in town and country. Cottage gardens now frequently grew Darwin Tulips.

British Carnation Society

The following new Carnations have been registered with the Society:—W. H. Wallace, seedling, colour deep salmon-pink, raised by the late Mr. W. H. Wallace and registered by W. E. Wallace, Eaton Bray, Dunstable; Catthorpe Cherry Red, sport from Baroness de Brienen, colour bright cherry-red, large fragrant flowers, habit of growth and stem as parent, raised by Mr. W. G. Donce, Catthorpe Manor Gardens, Rugby.

At a Council meeting held on June 25th the Chairman presented the late Secretary, Mr. Percy F. Bunyard, with the Society's Gold Medal as a token of appreciation for valuable services to the Society.

J. D. Simpson, Esq., Ashton-on-Ribble, offered to present two Gold Medals to the gardeners who show the best vases of five blooms at the Society's 1930 shows, and R. F. Felton, Esq., offered two Silver-gilt Medals as second prizes in the same classes.

The British Carnation Society's summer show will be held in conjunction with the National Carnation and Picotee Society on July 18th and 19th at the New Horticultural Hall, Westminster. The schedule, which contains a large number of classes in which valuable prizes are offered, is now available from the Secretary, F. W. Alesworth, 17, Avenue Road, Isleworth.

The raising of hybrid Asiatic Primulas

IN the interesting article by "B. O. M.," p. 448, the cross between P. pulverulenta and P. Beesiana is mentioned as producing an ugly shade of washy rose. I raised a plant from this cross with flowers of a good purple with the habit of P. pulverulenta. I cannot remember what happened to the plant, and as it was self-sterile I never got into the second generation with it. Regarding the seeding of the P. anisodoxa Hybrid, this has done so in this neighbourhood, and if I remember rightly, the seed parent was more P. anisodora than P. helodoxa. The results show 75 per cent. P. anisodoxa and 25 per cent. P. anisodora, the foliage of the hybrid being more P. anisodora than P. helodoxa in the majority of cases. I raised a hybrid between P. helodoxa and P. Bulleyana, but failed in every other attempt with other species. I have tried time after time to cross P. Sikkimensis with P. secundiflora and P. vittata, and now that P. microdonta violacea is in cultivation I am content to give up trying. There are two crosses which I feel sure are wrongly described and not mentioned in this article. One is P. pulverulenta Annesgrove Hybrid (I take the name as I have always known it). It is identical with the rose-coloured forms resulting from the P. Beesiana and P. Bulleyana cross, and I can see absolutely no P. pulverulenta blood in it, either in leaf or flower. The other cross is known as Moerheim Hybrids, P. Beesiana x P. pulverulenta, which is again identical with the P. Beesiana x P. Bulleyana. The description gives the plants the same habit and height as P. pulverulenta, and "vary in colour from yellow, orange, etc., etc." If the cross is as stated, how can the yellow and orange appear?

As "B. O. M." says, P. japonica does not cross readily, but I have found that the hybrids all possess stamina and good constitution and flowers of good form, but all appear sterile. I find some hybrids are quite sterile and others set plenty of seed, such as the Lissadell Hybrids and the majority of P. Beesiana x P. Bulleyana seedlings.

G. H. DALRYMPLE.

Bartley, near Southampton.

Primula Poissoni

I should like to know what is the experience of your readers with above Primula, as, although I have always been led to suppose it was a coarse, hardy, not too attractive Primula, I have lost my entire stock, whereas all my other Primulas have passed safely through the severe winter. I found that the crown rotted completely away.

Rutland. GUY FENWICK.

Primula pulverulenta Bartley Strain

Your correspondent, "G. C.," on page 447, does not give one any idea as to the number of plants of this Primula that were grown, and, therefore, as "one swallow does not make a summer," so I can hardly let my Primula be condemned if the decision rests upon a few plants only. As pointed out before, I grow mine on heavy clay, and always have done so. Does "G. C." trench and drain his, or her, heavy Sussex soil? I am tempted to exclaim, without wishing to be in any way personal, to "G. C.": "Is it never the fault of the cultivator when a plant dies?" I was asked to inspect some of these Primulas not long ago, several of which had died and the remainder were very sick. I found them growing in a sort of basin which in dry weather was flooded and then allowed to remain till it dried out again—no drainage at all. Can one wonder at the plants dying? And yet the owner was condemning the Bartley Primulas as not being hardy.

"J. R. K.'s" letter leads one to suppose

ton, Yorkshire.

"Grubbing off"

iced that in your last week's issue of ING ILLUSTRATED you remarked on the nce this summer of "grubbing off" Cauliflower and Cabbage. A very and at the same time a very effi- remedy for this is to put one tea- l of Scrubb's ammonia, or any simi- shing ammonia, into 1 gallon of soft and to water the affected plants with ixture. It must not, of course, be over the plants, but close round the This not only apparently kills the grub, but gives the plants a fillip, for one finds that they send out fresh roots, and in a short time entirely recover from the ravages of the grub. This remedy was told me by an old-fashioned gardener, but I find that it is as effective as it is simple.

Yorkshire. G. T. WHITEHEAD.

Lupin Munstead Strain

THIS strain of the fine old Lupinus polyphyllus is kept to the colouring of light blue-purple and white. Unlike other good modern kinds it is unwilling to vary in colour or habit. For a long time it never produced seed, and when at last a seed-pod appeared, it was hailed as a wonder. Since then it has seeded regularly, but never varied until a few years ago, when a white one appeared. This also bears seed, and is quite true to its colouring, a warm white, which suggested the name "Ivory" by which we now know it. The appearance of the strain is unlike that of the older sorts, for the spikes of bloom are bolder and handsomer, and the foliage is much better, the segments broader and flatter and of a brighter, lighter green, and with a general aspect of more strength.

G. J.

A bank of Lupin Munstead Strain

Mechanical cultivation

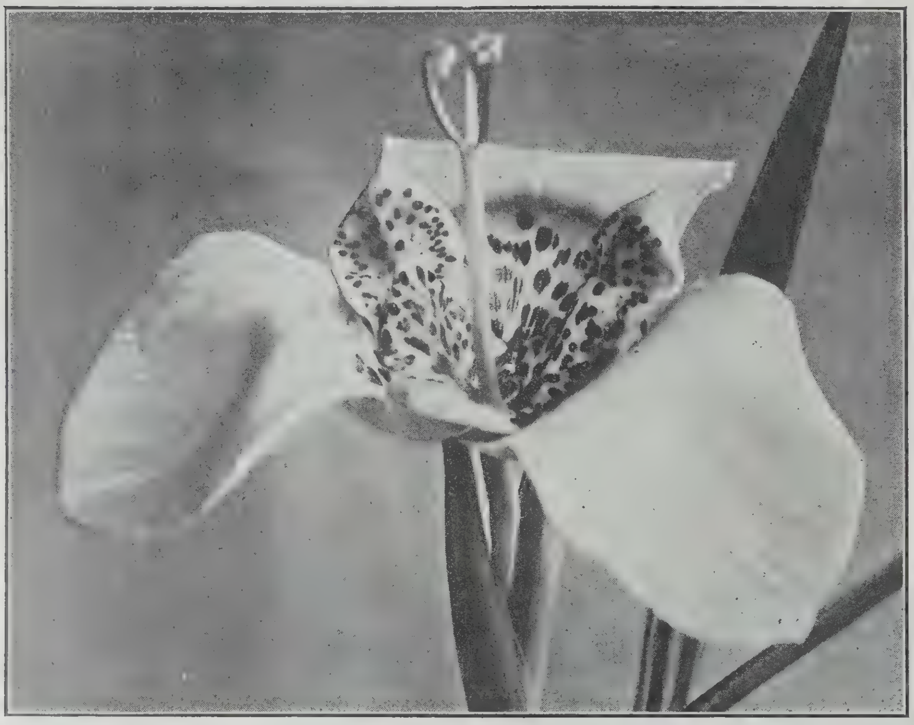
On page 457 of the issue of GARDENING ILLUSTRATED for June 29th there appears a note under Auto-cultivation in the garden. The general trend of the note is to the effect that, apart from the use of motor mowers, mechanical aid in garden work is practically useless. That mechanical cultivation is useless is, of course, absurd. There are hundreds of motor cultivators in use to-day, and I venture to suggest that if a visit could be made to all the owners of these implements and their views taken, few would like their money back, and I am equally certain that few cultivators would be found relegated to the tool house to rust.

To quote "A Scottish Gardener's" experiences of "less than a dozen years ago" is futile. Much has happened since "A Scottish Gardener" tried, with such bad results, his small motor cultivator. In the first place, motor cultivators have improved beyond all knowledge, and, further, the man behind the motor cultivator has improved too. I imagine that there is, to-day, many a garden boy having a quiet laugh over the motor cultivator that "wore out the patience of a very patient chauffeur." Motor cultivators to-day can be purchased which are extremely easy to run—half-an-hour's instruction is sufficient for most beginners, and breakdowns are few. If breakdowns occurred more often, perhaps, some gardeners would be a little more pleased with the motor cultivator. The breakdown would at least give an excuse to stop work, but, believe me, rests due to breakdowns are few and far between.

Let me take another sentence from "A Scottish Gardener's" experience—"the portions cultivated were turned over at unequal depths and the work, when finished, was a positive eyesore." In my experience a motor cultivator working in soil of a uniform hardness will plough or cultivate to a uniform depth, and the work, when completed, will stand comparison with the *Good Spade Hand,* but all jobs are not those on a soil of uniform hardness, most pieces of soil have hard and soft places, and a motor cultivator, if put into such a soil, cannot be expected to cultivate evenly. The usual practice with such soil is to go over the work twice. After the second time over, there is no just cause for complaint. Let me hasten to add that even if the motor cultivator has to go over the work twice it will do the work as well as the spade and in a quarter of the time.

The motor cultivator has, of course, its limitations. I have not yet met the sort that will trench a piece of soil, but surely, if motor cultivators were used more for the top 10 inches of soil, more time could be given to cultivate below this by means of the spade if such deep cultivation be necessary. Again, I have not met the machine that is of any use in the herbaceous border dotted about with plants of varying shapes and sizes. Hand cultivation will continue to be supreme under this condition.

My experience of motor cultivators shows me that they are the only means of reducing labour costs of a vegetable garden to an economic level. By means of mechanical labour gardens can be made much more tidy at less cost than without such labour. There



Tigridia conchiflora, a most beautiful yellow form with purple spotted cup

are few commercial vegetable gardens to-day that are run by hand labour. Horse labour gradually replaced hand labour, and now, in turn, motor labour is very gradually displacing horse labour. Private gardens have not taken up motor cultivators to any great extent because the men running such gardens are too conservative in their outlook, and still think that the only way to cultivate the soil is to dig it by means of the spade in spite of the high cost of such labour.

Let me plead with all inquirers, such as "A. D. G. G.," to get into touch with the various firms who make motor cultivators and allow the firms concerned to show them exactly what the various cultivators can do. The result will surprise most *Spade Lovers*. The writer's job takes him into many gardens where motor cultivators are used and appreciated. The owners of the machines would not—nay, could not—do without them.

JACK.

A beautiful hedge

I can quite adequately support Mr. R. E. Arnold's recommendation of Berberis Darwinii as a hedge plant, for the finest hedge, from every point of view, that I ever saw was one of this Berberis in Northern Ireland. It was planted above and behind a low stone wall bordering an estate, and was fully a quarter of a mile in length, without a break. Evidently it had been allowed to grow on its own and had received no attention in the way of cutting whatsoever, with the result that it was completely satisfactory in every detail, whether utilitarian or artistic. It is no exaggeration to say that when in full bloom it was worth going miles to see. It would be quite 12 feet in height above the wall top, and at least half that distance through.

But, judging by the behaviour of this and some other Berberises this winter, I doubt whether there are many parts of this country where it would attain to such magnificence. With us in North Yorkshire Berberis Darwinii, B. Wilsonæ, and B. stenophylla have all suffered most severely during the past winter, the former particularly where grown as a bush in the shrubberies. In some cases quite half the wood is dead.

Skipton, Yorkshire.

The Tigridias

IT is pleasant to see the cause of the Tigridias championed by H. H. Warner in a recent issue, although it may not appear to some that these gorgeous plants are in keeping with the ordinary occupants of the rock garden. May I suggest devoting a small bed of light but rich soil in a sunny part of the garden to the Tigridias? This I have done, and the result, when the sun shone, was enough to delight anyone, as, apart from the form of the flowers, which is very beautiful, the colours are of such a glowing character that all who see such beds are full of delight with them. The only fly in the ointment is that they need full sun, and, possibly, another might be suggested regarding keeping the roots. It is not enough where frosts are severe to hang them up in a shed. The place must be frost-proof, or they should be stored in dry sand. I prefer the latter as they do not appear to shrivel so much as when hung up.

ESS.

A proposed Rock Garden Society

I see we are threatened with another garden society, this time a Rock Garden Society, but where is it all going to end? We already have Narcissus, Iris, Rose, Rhododendron, Sweet Pea, Delphinium, etc., societies, and soon, I suppose, someone will want Aspidistra and Spotted Aucuba Societies. Of what advantage is a rock garden society going to be to anyone? I have had a rock garden for a great number of years, but I do not think it would have been either better or worse for the existence of a "Society." I can imagine a show of rock gardens being more interesting than one, say, of Sweet Peas, Delphiniums, or even Roses. The society shows of one kind of flower are really very boring, and as for a Sweet Pea show it is positively nauseating. The fortnightly shows of the R.H.S. are really much more interesting, and the best of every kind of flower may be seen at them. As your correspondent, Mr. H. E. Seaton,
says, "There is no subject on whi
is more disagreement than rock ga
but as to a society promoting "eve
happy discussion," I am exceedingly
ful. Judging by the amount of critic
bad feeling the rock gardens at Che
gender, I am afraid there would ra
incessant wrangling, and your column
be filled with indignant letters fron
pointed exhibitors.

On the whole, I think we are b
without any more societies—there
many already.

Iris Quaker Lady

IS charming Iris, brought out by Farr
1909, is one of the most useful in the
rden. The colouring is a wonderful
ny of tender tints. The standards are
curious kind of faint smoky-yellow
ed with an equally tender lilac. The
are first veined with pale brown on
ish-white, broadening into the wide
of tenderest warm lilac. The whole
of the flower is of a glowing yellow, strengthening to a brilliant orange in the ample beard. The habit of the plant is rather short and compact, and as each stem carries at least six blooms it is richly filled, though not overcrowded.

G. J.

Colour values in flowers

THERE is no doubt of the necessity for a clear definition of colour in flowers to be laid down for the help of the average amateur gardener.

When very much of a novice the writer remembers well how keenly felt were the disappointments when the chosen lilac Poppy blossomed pink and the blue Stocks and Asters desired turned out to be mauves and lilac shades, and no Campanula, tall or dwarf, ever reached an azure tint.

In any case there is a great deal to be said in favour of seeing flowers growing—there is always something indescribable in form and colour—and different effects appeal to different people. A clustering spray of small French-grey flowers might be even dingy, when the large blossom of the Periwinkle (Vinca difformis) of same shade and more beautiful texture, resting on its Myrtle-green leaves, is a thing of great beauty. Nature's elusive painting is too beautiful and too difficult for description.

The old maize-yellow of the Scotch Rose might find its source in golden-yellow, which, through lemon and canary shades, could be brought down to palest sulphur tints. Carmine might bring us down to rose and blush pinks, ruby-crimson to coral, shrimp, and flesh-pink. Myosotis-blue seems easily defined, Gentian equally so, through many gradations to palest porcelain-blue. Royal blue, which breaks away from the abovementioned, runs through shades of Hydrangea, Periwinkle, Plumbago, Wedgewood to French-grey, influenced by a suspicion of carmine.

Nana cœrulea, the supposed blue Phlox, never justifies its name, and then only very slightly, until evening light. The purple Phloxes, Le Mahdi and Marvel, are never really purple until the same time.

The obtrusiveness of crimson is not always admired. There were at one time many shades of magenta that were very unpopular, but since the advent of Bois de Rose some of these shades have been found quite useful. A stretch of rock garden well planted with various shades of pink Phloxes and Aubrietias, including the faintest of the pinks, and well set off with silvery Artemesias of the low, spreading variety, looks very well. The scheme may be deepened with shades of Aubrietia Souvenir Ingram, and still further deepened by adding rich mauve and purple colours.

Mauve and lilac tints may be brought into harmony with light blue shades, and very often flowers arrange themselves more or less, or suggest ideas which only require a little assistance in restraining form and colour here and there. The exquisite word-painted pictures from a celebrated garden which we have the privilege of reading, from time to time, in GARDENING ILLUSTRATED *are* of the most intense interest. It is there that the poetry of flowers is understood, and the gifted lady who has created so much beauty gives many a valuable idea to the readers, whom her words really thrill.

E. A.

National Sweet Pea Society Show

Held in the New Hall of the Royal Horticultural Society, Westminster, on Wednesday and Thursday of last week, the annual exhibition of the National Sweet Pea Society was well up to standard. The number of entries was large and the standard of the exhibits high.

Sutton and Sons, of Reading, gained a large gold medal for a magnificent display of about 60 varieties. The Eastbourne Cup went to Dobbie and Co. for one of their two groups, the other gaining a gold medal. E. W. King and Co. were awarded the City of Bath Cup. Major C. B. Krabbe, as last year, won the "Daily Mail" Cup, Mr. F. W. Franks, of Tonbridge (gardener, Mr. W. Humphrey), won the Sutton Cup and also the medal for the best exhibit in classes not open to the trade. The cup for the best six vases (amateur) was won by Mr. A. Cole, of Basingstoke, and Mr. Samuel Wallrock won the cup for the most decorative display of Sweet Peas shown by an amateur.

Iris Quaker Lady

The National Rose Show

GREAT SUMMER SHOW AT CHELSEA

NOTWITHSTANDING the drought of the past months and the squally weather of late, the summer show of this popular Society may be described as a great success. There were Roses in abundance in magnificent form and beautiful condition. The Queen, accompanied by Queen Amélie and attended by Lady Ampthill and Sir Harry Verney, honoured the Society with her presence on the first day. Her Majesty took away with her a specimen bloom of each of the three new Gold Medal Roses. The 74 classes, comprising the show, were generally well filled.

NURSERYMEN'S SECTION

The chief class in this section was for the Championship Trophy for a representative group of cut Roses shown on a space 40 feet by 4 feet. On this occasion there were no fewer than eight competitors, leading honours being awarded to A. Dickson and Sons, Hawlmark, Newtownards, Ireland. This was a beautiful group, which included in its display new and choice Roses at their best. Glorious examples of cultural skill were Flamingo, Edith Nellie Perkins, Swansdown, Emma Wright, Mabel Morse, Julien Potin, Lady Inchiquin, Dame Edith Helen, Adela Crofton, May Watson, Scarlet Glory, Betty Uprichard, and a host of other good things.

Mr. Elisha J. Hicks, Hurst, Berks, also showed extremely well to win second prize. Ivy May, A. Pernet, Gooiland Beauty, and Mabel Morse being noteworthy varieties. The Stanway Rose Gardens, Colchester, were third and J. Waterer, Sons, and Crisp, Twyford, Berks, fourth.

A smaller group of cut Roses shown on a space 20 feet by 4 feet is always a source of interest both to the trade and the public. The De Escofet Memorial Cup is awarded to the first prize winner. The place of honour was secured by J. Harkness and Co., Hitchin, with a very handsome and striking group of well-grown Roses at their best. A few of the better kinds were Mme. Butterfly, Golden Gleam, Lady Inchiquin, Betty Uprichard, Mrs. Beatty, Shot Silk, Patience, K. of K., Rev. F. Page Roberts, Mrs. Henry Morse, Golden Emblem, Lamia, and Sovereign—a really superb group. Second prize was awarded to Mr. Geo. Prince, Longworth, Berks, who staged a beautifully representative group. The "Daily Mail" scented Rose and the white Elizabeth Arden were noteworthy. Dowty's Nursery, Wokingham, were a good third. The third competition in this section was for a representative group of cut Roses shown on a space 10 feet by 4 feet. Mr. John Mattock, Headington, Oxford, who had a grand series of stands, displayed well-grown Roses at their best. Outstanding varieties were Mrs. Henry Morse, Mabel Morse, Mrs. Beatty, Lady Roundway, Dame Edith Helen, Climbing Ophelia, K. of K., and Shot Silk. A good second were Jarman and Co., Chard. This firm had some especially good stands, such varieties being Shot Silk, Hortulanus Budde, Mabel Morse, Mrs. H. Morse, Betty Uprichard, and Mrs. Herbert Stevens. An interesting display won third prize for Mr. D. Long, Gt. Horkesley, near Colchester, Lady Inchiquin and Mrs. H. Bowles being noteworthy sorts in this exhibit.

DECORATIVE ROSES IN BASKETS

The premier class here was one for seven baskets of cut Roses, seven distinct varieties, not more than 36 stems of one variety to be shown in each basket. There were only two exhibitors, the first prize series standing out for their excellence and beautiful character. This came from Mr. John Mattock, who was obviously in good form at this show. His varieties were Mrs. Tresham Gilbey, Angele Pernet, Betty Uprichard, Louise Criner, Lady Inchiquin, Golden Emblem, and Shot Silk. Second prize was awarded to Mr. H. Drew, Longworth, Berks. His better kinds were Mrs. Henry Bowles, Lord Charlemont, Mrs. Henry Morse, and Lady Inchiquin.

In a similar class, but for three baskets in three distinct varieties, first prize was awarded to D. Prior and Son, Colchester, who showed in excellent form and condition Lady Pirrie, Col. Oswald Fitzgerald, and Mme. G. Herriot. A beautiful series secured second prize for G. Longley and Sons, Rainham, Kent. Their varieties were Golden Emblem, Col. O. Fitzgerald, and Norman Lambert.

It is good to note that the Society has provided a class for three baskets of Polyantha Roses in three distinct varieties, which is becoming increasingly popular. Not more than 24 stems of each variety may be shown. On the present occasion first prize was won by G. Longley and Sons, who showed beautiful baskets of Kirsten Poulsen, Diana, and Else Poulsen, the last-named being very charming. Second prize was secured by W. Cutbush and Son, Ltd., Barnet, Herts, who showed lovely baskets of Frank Leddy and Golden Salmon, and the new variety, Sunshine. D. Prior and Son were placed third with a pretty series.

ROSES IN VASES

The leading competition in the Nurserymen's Section under this head was for 30 distinct varieties, not less than three or more than seven stems of each variety, for the A. C. Turner Challenge Cup. Premier honours were awarded to Mr. J. Mattock, Headington, Oxford, who staged, among other good varieties, Betty Uprichard, C. E. Shea, Mrs. G. A. van Rossem, Lord Charlemont, Golden Emblem, J. C. Thornton, Lady Inchiquin, Louise Criner, Shot Silk, Francie Simms, Etoile de Hollande, Lady Dixon Hartland, Independence Day, Emma Wright, and Ivy May. Second prize was awarded for a good, even series to A. Warner and Son, Boxted, Colchester. This grower showed beautiful examples of Patience, Golden Emblem, Shot Silk, Henrietta, Golden Gleam, Betty Uprichard, Hortulanus Budde, and I Zingari. Third prize was awarded to Mr. George Lilley, Cippenham, Bucks, with a nice, fres
blooms.

competition for 12 blooms of any new distributed since January 1st, 1925, on ccasions has given prominence to the ualities of certain new kinds. On the n under notice there were no fewer seven good exhibits, and they were a feature in the nurserymen's tent. grand blooms of Mrs. Beatty, B. R. nd Sons, Ltd., were placed in the lead- sition. Twelve grand blooms of Dame Helen won second prize for Dowty's y, Wokingham; the "Daily Mail" l Rose, shown by Mr. Geo. Prince, won rize.

HIBITION ROSES IN BASKETS

first class was for one basket of cut one variety of H.T.'s, not more than oms. There were six competitors, rize being awarded to grand examples sie Chaplin, shown by Mr. J. Mattock. good examples of George Gibson G. y and Sons were placed second; and basket of Admiration, J. Jefferies and td., Cirencester, came third. There was class for one basket of cut Roses, one of Teas or Noisettes, not more than oms. First prize was awarded to Jar- nd Co. with nicely finished examples of n Cochet. Second prize was won by . Drew, who staged Mrs. Foley Hobbs, vith quite good blooms of Mrs. H. s Mr. George Prince secured third

Brayfort Challenge offered for one of cut Roses, one variety, not more 4 blooms, H.P., H.T., T., or N., put ommerce after January 1st, 1923, in stance was won by A. Warner and Co., d, with a grand lot of blooms of Mar- McGredy. Mr. George Prince was l with the "Daily Mail" scented Rose, ith good examples of Maud Cumming ohn Mattock was placed third.

ARTISTIC CLASSES

Nurserymen's Section

Decorative Classes are always an un- source of pleasure and interest to the oving public, and at most shows of this l Society there is generally something and pleasing to be seen.

ss 17 provided a decoration of cut for dinner table, arranged with Rose only, on a table space 6 feet by 4 First prize was won by Miss M. Archer, rd, Kent, for a very lovely decoration ich the exhibitor utilised the beautiful Rose, Dainty Bess, most advantage- using as an embellishment beautiful foliage. With ideal blooms of Rose- , Mrs. L. R. May, Waltham Cross, an exceptionally good second, her s being disposed most artistically. us blooms of the new Duchess of Athol a good third prize display for Mrs. Bide, Farnham, and fourth prize was ed to Mrs. C. A. Tisdall, Woodford , with Betty Uprichard. Class 18 pro- for a bowl of cut Roses arranged with foliage, but small buds were allowed e added foliage. The seven entrants a beautiful display, a most artistic bowl oselandia gaining first prize for Mrs. ll. With lovely blooms of Irish Fire- Golden Emblem, and Angele Pernet. A. H. Harraway, Warminster, was l second. Mme. Butterfly as arranged s. May secured third place, and fourth was won by Mrs. A. F. Chaplin, am Cross, also with Mme. Butterfly.

The class for a basket of cut Roses, lightly arranged with Rose foliage only, was quite good. First prize was won by Mrs. Tisdall, who had a glorious basket of Mme. Butterfly superbly arranged. With the same variety Mrs. A. F. Chaplin was second, and third prize was secured by Mrs. A. R. Bide with a lovely decoration of Lily Kemp, a richly coloured semi-double variety. Miss E. Smyth, Mitcham, Surrey, was placed fourth with Mme. Butterfly.

In the same section there was a class for a vase of cut Roses, lightly arranged with Rose foliage. Four competed, Mrs. Tisdall easily winning first prize with a charming vase of Mme. Butterfly. Mr. R. E. West, Reigate, was second, and Mr. A. H. Harraway third with Mrs. Beatty. With a pretty vase of Columbia, Mrs. A. R. Bide was a good fourth.

Shown by Alex. Dickson and Sons

Amateur Section

It is not possible to mention more than two or three of the leading classes in this section. The most noteworthy competition under this head, of course, was for the Champion Trophy, which is offered for a representative group of cut Roses, shown in a space not exceeding 6 feet by 4 feet. There were five entrants, each exhibitor staging most praiseworthy groups of Roses. On this occasion the premier position was well won by Mr. G. Marriott, Carlton, Notts. His display was most attractive and striking. Some of the better Roses in this exhibit were Souv. de G. Pernet, Lady Inchiquin, Mrs. Henry Morse, W. F. Dreer, Eva Eakins, Gwynneth Jones, Betty Uprichard, Rev. F. Page Roberts, and Emma Wright. A good second was seen in the display of Dr. R. C. Turnbull, Colchester. Third prize went to a former champion, Mr. J. N. Hart, Little Heath, Potter's Bar. His stands of Penelope, Trier, and Paul's Scarlet Climber were beautiful. Mr. S. W. Burgess, Tonbridge, was awarded fourth prize.

The Edward Mawley Memorial Medal was also awarded to Mr. Marriott's Champion Trophy Display for the most meritorious exhibit in the Amateur Section.

The Cecil Cant Challenge Cup offered for a smaller group, set up on a space 4 feet by 4 feet, was won by Mr. W. H. Pickford, Gloucester, who staged a quite effective group of well-grown Roses. His better blooms were:—Angele Pernet, Ophelia, Golden Emblem, Emma Wright, Elizabeth of York (lovely), I Zingari, Else Poulsen, and Kirsten Poulsen. Mr. H. R. Darlington, Potter's Bar, was awarded second prize.

Other successful amateur growers were Messrs. Norman Rogers, H. E. Moore, R. White, G. Brown, A. C. Turner, A. L. F. Cook, H. E. Cribb, S. E. Tattershall, E. H. Pleasance, F. H. Fieldgate, J. E. Rayner, C. H. Rigg, H. F. Spicer, E. T. Gann, Miss Gardner, Miss Handcock, Mrs. L. Tilley, and Mrs. Mappin.

LADIES' ARTISTIC CLASSES (AMATEURS)

The competitions in these classes were again exceedingly popular. Class 65 provides for a decoration of cut single-flowered Roses for dinner table, lightly arranged with Rose foliage only, on a space 6 feet by 4 feet. The competition was quite good, Miss Newsham, Aughton, Liverpool, being a good first with a charming table of Dainty Bess. With the same variety, Mrs. L. Courtney Page, Earldoms, Hayward's Heath, was placed second. With a table arranged with Irish Fireflame, Miss M. Woolven, East Grinstead, was awarded third prize.

Class 66 for a dinner table decoration of cut Roses in which any Roses except single-flowered varieties may be used was also of much interest. There were again as many as six entrants, first prize being well won by Mrs. Courtney Page, who used magnificent blooms of Mme. Butterfly most effectively. A superbly arranged decoration of Roselandia won second prize for Miss M. Woolven. This exhibit was as fresh on the second day as it was on the first. Another beautiful table of Mme. Butterfly secured third prize for Miss E. J. Cooper, Wallingham, Surrey, and with a further table of Mme. Butterfly, Mrs. Charlton, Yiewsley, was placed fourth. The class for a basket of cut Roses, arranged with Rose foliage only, found no fewer than seven entrants. Miss Woolven was again successful, winning first prize with a lovely basket of Mme. Butterfly, superbly arranged. With Lady Isabel, Mrs. A. D. Ruff, Sharnbrook, Beds., was an interesting second, and Miss Newsham, Liverpool, whose basket had been upset, was third. Mrs. Courtney Page was fourth with Mme. Butterfly arranged on original lines.

A vase of cut Roses on somewhat similar lines was a competition in another class, which found as many as seven competitors, Miss E. J. Cooper easily winning first prize with grand blooms of Mme. Butterfly. With the same variety Mrs. A. D. Ruff was a good second, and again with the same variety Mrs. Courtney Page was placed third.

Class 69, for a decoration of cut Roses for the dinner table, is always popular with exhibitors. This is open to lady amateurs who, without assistance, grow their own flowers. The six entrants made a pretty and unusual display, Mrs. Courtney Page with Emma Wright, of splendid colour, winning first prize. Miss Emily Griffith, Dollis Avenue, Finchley, won second prize with Betty Uprichard, well displayed. Third prize was awarded to Mrs. F. Oakley Fisher, Sudbury, who used blooms of Emma Wright, Old Gold, and Irish Fireflame. Again with Emma Wright, Miss Woolven was awarded fourth prize.

Class 70, for a bowl of mixed cut Roses, was won by Mrs. Courtney Page with a very charming arrangement. Miss E. Griffith was placed second and Miss Woolven third, all showing well.

A good group of Delphiniums shown at Vincent Square by W. Wells, Junr.

Class 71 was for a table decoration open to those who have never won a first prize in the Decoration Section at any of the Society's shows. The four exhibits were most praiseworthy. With richly coloured blooms of Emma Wright, Mrs. A. A. Yates, Warwick, was a splendid first prize winner. Her arrangement was all that could be desired. Mrs. M. F. Fraser, East Grinstead, with a beautiful decoration of Mme. Butterfly, was placed second, and with the same variety Miss W. Walker, Rivercourt Road, W., was awarded third prize.

In Class 72, for a bowl of cut Roses, open to the same kind of exhibitor, there were four entrants, Mrs. M. F. Fraser winning first prize with Mme. Butterfly charmingly disposed. Mrs. A. A. Yates was second with Roselandia, and Mrs. H. Williamson, Canterbury, third with a glorious bowl of Roses.

Class 73 was another class for a table decoration of cut Roses for dinner-table, open to lady amateur novices. First prize was won by Miss E. Charlton, Yiewsley, with a pretty decoration of Mme. Butterfly. Miss B. Yates was second with Roselandia, and third prize was won by Miss E. Robins, Ingatestone, with Emma Wright.

THE NICKERSON PRIZE

This prize is given for the best new Rose of British or American origin sent out between June 1st, 1922, and December 31st, 1927. The exhibits must consist of not more than 36 stems of any one variety arranged in a fan-shaped stand. There were no fewer than 25 exhibits, comprising most of the better varieties of comparatively recent origin. Messrs. Dobbie and Co., Edinburgh, gained this distinguished honour with their wonderful novelty, Duchess of Atholl. It is a beautiful Hybrid Tea Rose of splendid form and substance, and of a rich orange colour—most outstanding. The Nickerson Cup is of the value of £30.

NEW SEEDLING ROSES.

The new Roses were, as usual, shown in a tent specially set apart for the purpose. A Gold Medal was awarded to each of three varieties mentioned in the subjoined list.

Gladys Benskin.—This is a beautiful Hybrid Tea Rose of a soft pink col yellow ground. It is large and of g and substance, and is described by t as being free-flowering and vigorous.

Aureate.—Another Hybrid Tea good form. The colour is described as a rich golden yellow, but saffro is a better description. Erect and fre ing. The two varieties above-mentio shown by Messrs. Alex. Dickson a Ltd., Newtownards, Ireland.

Elizabeth Arden.—The blooms are shape and produced on long stems colour is almost pure white. F Habit of growth vigorous and free. by Mr. George Prince, Oxford.

A Certificate of Merit was awarded of the following new Roses :—

Chaplin's Crimson Glow.—A pr Hybrid Wichuraiana Rose, very fre ing, developed in beautiful trusses. crimson. Shown by Messrs. Chapli Ltd., Waltham Cross.

Trigo.—A Hybrid Tea Rose of Colour soft yellow. Shown by Messrs Dickson and Sons, Ltd.

Mrs. Johnstone.—A vigorous g Hybrid Tea Rose. Colour soft pink. by Messrs. Bees, Chester.

Peter Pan.—A Hybrid Tea Rose glorious orange terra-cotta colour, rem one of the colour of Emma Wright. by Messrs. Wheatcroft Bros., Gedling,

The Delphinium Show

HAT a triumph this show has been for the Delphinium and the new British Delphinium Society! Here re visiting the first show of a Society year old, and yet it fills the new Horti- al Hall with wave on wave of varying such as the Delphinium alone can and presenting, as a whole, such a that no words can adequately describe d do it justice. The very mode of g the large competitive groups in the of the hall was a stroke of genius, cidentally gave an answer to the critics e new hall. With the Delphinium it came into its own, and it has never more regal as one viewed its grey out- rough vistas of dark and light blue.

Delphinium has always had an im- t place in the garden, but never has it so pronounced as in recent years, when urs and professionals alike look upon very king of the early summer garden, having this in mind, a body of keen siasts formed "The British Delphinium y" with the object of encouraging the ction of new and improved varieties and llection and dissemination of all useful ledge regarding this flower. That they ded in doing both these things was ced at this show, and by the remarks on all sides it was a show of which any y might be justly proud.

large competitive groups brought out at is best in the Delphinium and ed full play to the artistic tastes of the itor, and in such groups as these, ring 36 feet by 8 feet, it was no easy to keep them on the light and graceful but the exhibitors scored on this point e way through. We have to congratu- Blackmore and Langdon on winning largest class, which carried with hallenge Cup and the large Gold Medal Society, with what I consider the finest of Delphiniums ever exhibited.

arrangement was perfect, and the large ts employed to raise the centre were ularly effective. Here we found all s best in the Delphinium, both from the of variety and culture. Blue Bird, its semi-double flowers of rich deep blue, at its best, and so was Lady Edith, a variety with lavender flowers and a dark Lady Grace is semi-double and of a ower-blue, while Mrs. Newton Lees is inating mauve. Of the vast number of ies in this exhibit one can only say they all tip-top.

second prize went to W. Wells, of tham, who had some grand spikes of E. Lascelles, a well-tried favourite now, Harry Smetham, a flower of rich lain-blue and perfect shape, Joan r, lavender with a white eye, and that garden variety, Mrs. Colin McIvor.

J. Jones was third with a splendid col- n of such sorts as Purple Robe, Mrs. s, Phyllis (a lovely shade of mauve), and sty.

it not interesting to know that all these grown within 7 miles of London Bridge? rs. Hewitts, of Solihull, were also in class, and had some fine spikes of Will espear, a variety said to grow 8 feet 4½ feet of which is flower.

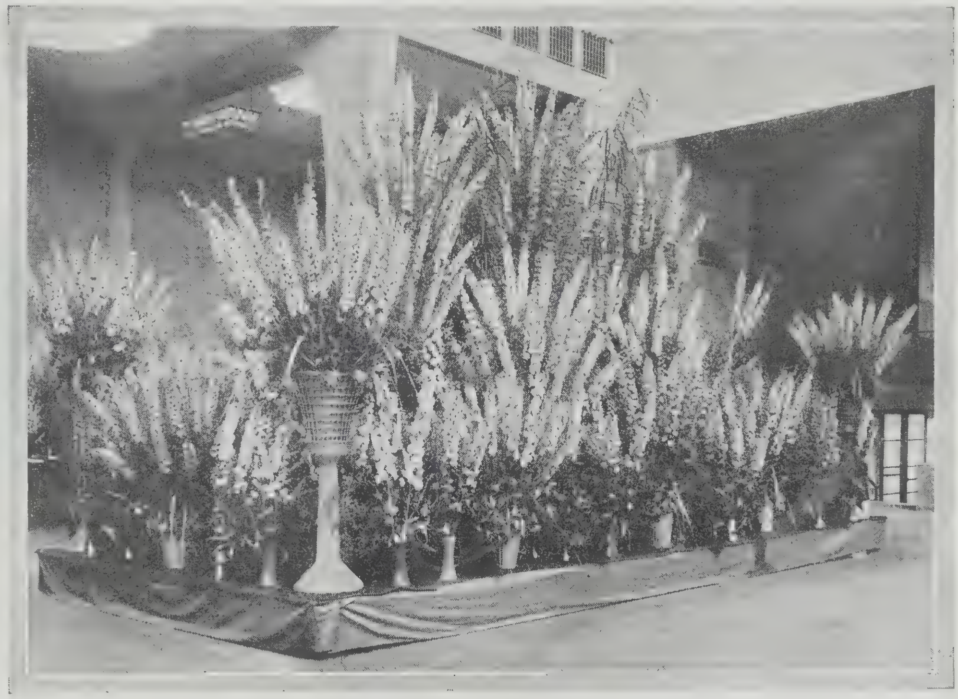
other group class brought some splendid rs from T. Carlile, Loddon Nursery, ord, who was the winner of first prize he Gold Medal. He had Mrs. H. Kaye, n Mary, Gwen (a Cambridge-blue with e shading), and the dark Mercurius, all e condition.

Bones, of Cheshunt, was second, having ovelty, Hunsdon Hall, in quantity, and others, all equally well grown.

Gavin Jones was third with a varied collection, amongst the best being Dusky Monarch and Harry Smetham. S. J. Goodliffe, of Bishops Stortford, had some extra good varieties in his exhibit, but none stood out so prominently as Pannonia (a rich, deep blue with a white eye) and the strong-growing Walter T. Ware.

In two other important trade classes Blackmore and Langdon were first, while T. Carlile was second, and in both cases the very cream of the family found a place, while they were the last word as far as culture, and made one wonder where the improvement of the Delphinium will end.

Other trade classes brought equally good stuff, and there was keen rivalry in all these. Among other firms showing were Kelways, of Langport, Bakers, of Wolverhampton, Whitelegg, of Chislehurst, and others, all adding their quota to a wonderful display.



Blackmore and Langdon's winning exhibit at the Delphinium Show

A large number of novelties were put up for awards, and the following were successful in gaining a First-class Certificate:—Lady Bath (a double mauve of wonderful substance) and Bleu Gown (a mid-blue of great promise), both these being shown by Blackmore and Langdon. Mr. T. Bones also gained a similar award for Hunsdon Hall and Mrs. Hargreaves.

Awards of Merit were given to Pompadour, from Hewitts; Mrs. Paul Nelke, Lady Elizabeth, and Lady Emsley Carr, from Blackmore and Langdon.

I must now speak of the amateur classes, and I frankly confess that, good as these were, they were not competitive enough, through lack of entrants. Where were all our readers who grow Delphiniums so well?

I do not propose to go into details of all the classes, but only the most important ones, though I must say that the standard reached in these was a very high one, bearing in mind the difficult season.

The class for the best arranged vase was hotly competed, and the first prize went to Mr. W. C. Blakeway, of Droitwich, Mrs. Hamilton, of Claygate, being second, with Mrs. E. A. Gold, of Wimbledon, third, the flowers and arrangement of these three being very good; but the others in this class did not bring out either the best in the flower or in artistic arrangement.

The basket of Delphiniums was not so well contested as one would expect from such an adaptable flower, the main defect being that the flower-stems had been shortened too much, though the winning efforts were good. Mr. L. D. Corder, of Bromley, Kent, was first with a very fine basket, while Mrs. S. H. Roberts, of Thornton Heath, came second with a rather charming boat-like basket well arranged. Mr. C. Reynolds was third.

Class 6, for six varieties, the first prize and Bronze Medal being presented by GARDENING ILLUSTRATED, was won by Mrs. J. M. Dolura with finely grown spikes, second Mrs. E. A. Gold, and third Mr. C. Reynolds.

A Challenge Cup was offered for six single spikes raised by the exhibitor, and this was splendidly won by Mr. W. C. Blakeway, who had some very charming things, especially a light blue, which attracted much attention and was named at the show Mrs. S. H. Roberts.

Mr. Blakeway again won in a class arranged on a table 8 feet by 3 feet, and here again we had examples of both culture and quality.

In a class for 12 spikes Mrs. Hamilton won with long, healthy examples of well-grown flowers, which even late in the day still preserved their freshness—a true test of value of all cut flowers.

In Class 7 Mr. Corder won with 12 topping spikes, especially his blooms of Modesty and Peacock.

A small group, not for competition, was put up by an amateur, Mr. A. J. Moir, and this was praised by all who saw it, especially some spikes of Welshman, F. W. Smith, and Mrs. T. Carlile.

I think these notes will prove that as a first show this was a wonderful accomplishment, and if one may be allowed to say it, I think it is due to enthusiasm of the lovers of the Delphinium, both amateur and professional, and our hearty congratulations are offered to the Committee and those two live wires, Mr. S. Halford Roberts, the Secretary, and his assistant, Mr. A. J. Moir.

J. S. D.

Some Asiatic Primulas of Comparatively Easy Cultivation

It is surprising how many gardeners are under the erroneous impression that the majority of Primulas from the Chino-Thibetan region are bog plants. The unfortunate result is that some cultivators seek the wettest places they can find to grow their Primulas, and which too often is a stagnant bog. Others, and especially owners of small gardens, much as they would like to cultivate this lovely and diverse family of plants, are apt to consider themselves unable to do so, owing to the lack of boggy positions in their gardens. If, however, we study the natural conditions under which these Primulas grow we shall find that the majority of species grow in Alpine meadows and woodlands rather than bogs. We must also take into our consideration that the climate of the Chino-Thibetan region is the reverse of ours, for it is a country of dry winters and wet summers. Consequently, although many Primulas may thrive in very damp places during our summer months, cold, stagnant conditions during winter are quite foreign to their nature, and usually results in a heavy mortality.

I readily admit that the Sikkimensis group especially, and many of the candelabra series, may often be found perfectly happy under very moist conditions all the year round, but much depends on the position. A damp slope or a stream-side affords very different growing conditions to a stagnant bog, the fundamental difference being that moving or running water is aerated, whereas still water is not. This is an important point in the cultivation of Primulas which cannot be too strongly emphasised, and growers who complain that certain species are tender in their gardens will usually find that it is the conditions and not the hardiness of the plants which are at fault.

Although woodland and streamside is undoubtedly the best setting for moisture-loving Primulas, there are many places in the garden proper where they may be accommodated, and in small gardens, where the facilities are limited, a border which is a little too shaded for the general run of herbaceous plants to grow and flower normally will usually provide a congenial home for Primulas, and, incidentally, their fellow-countrymen, the Meconopsis. There are, however, two essential points necessary for success:—

(1) Plenty of half-decayed leaves or other forms of humus should be worked into the soil.

(2) The plants must not suffer from drought during the summer months.

P. japonica and P. pulverulenta will endure excessively damp positions more than most Asiatic species, but they will also grow and flower freely in such a border. The brighter-coloured varieties of P. japonica should, however, be placed in the more shaded positions as the colours are apt to bleach in the sun.

The Bartley Strain of Primula pulverulenta will not suffer winter damp with quite the impunity of the type, but they are perfectly happy in a half-shaded border which can be kept moist in summer, or in Rhododendron and Azalea beds. Moreover, their delicate pink shades tone beautifully with Rhododendrons, and there are few more charming combinations than the Bartley Strain Primulas and Japanese Azaleas.

Of the yellow-flowered Primulas belonging to the candelabra group P. helodoxa is superior to P. Smithiana. I would recommend growers who do not care for massings of yellow to try a few plants of P. helodoxa sprinkled amongst the best forms of P. japonica, and I think that they will be charmed with the result.

P. Poissonii and its allies, P. angustidens, P. Wilsonii, P. glycosma, and P. oblanceolata, are so closely related and their botanical differences are so small that two only need be considered. P. Poissonii is certainly the best, for the flowers are carried almost at right angles from the stems, or, in other words, they look at you, whereas the flowers of the other species are more or less pendent, which tends to hide their beauty. Of these, P. Wilsonii or P. glycosma may be selected. The closely related P. anisidora is worth growing for its deep maroon flowers. This species crosses freely with P. helodoxa, the product being a pleasing hybrid of a crushed strawberry shade.

Other notable species of the candelabra group are P. bulleyana, valuable for its late flowering and the parent of many charming hybrids; P. Burmanica, a finer species than P. Beesiana and much hardier than its name suggests; and P. Cockburniana. This dwarf species is more at home in the rock garden than at the streamside, and is very effective when boldly massed. One of our most thriving colonies is growing on the residue of an old and disused stone quarry, where self-sown seedlings are so abundant that it might be said to have naturalised itself.

The Sikkimensis series is rather bewildering to many amateurs, who find considerable difficulty in differentiating between the various species. They may roughly be divided into two groups:—

(1) Those species having cordate leaves, which include P. Florindæ, and P. microdonta and its varieties alpicola and violacea.

(2) Those having cuneate leaves, as in the typical P. Sikkimensis. These include the dwarf P. pudibunda, P. Waltoni, P. prionotes, also P. secundiflora and P. vittata. The chief difference between the two latter species is that the flowers of P. secundiflora hang on one side of the stem only, whereas in P. vittata they form the complete whorl.

Fairly moist conditions are necessary for the successful culture of all species of the Sikkimensis series.

P. involucrata and its allies P. Wardii and P. chrysopa are also moisture-loving Primulas, but they should be cultivated in fairly open positions. This especially refers to P. chrysopa, which becomes drawn and weak in semi-shaded positions.

The nivalis is one of the largest sections of Primulas, but it is singular how few have proved amenable to general cultivation in our gardens. The chief trouble is that they cannot withstand our damp winter conditions. A fairly open and well-drained position is, therefore, essential to success. The plants should also be placed in their flowering positions when comparatively young, and never disturbed unnecessarily. P. chionantha and P. sino-purpurea are, perhaps, the most reliable species, but another species belonging to this group, P. pulchelloides, which was collected by Capt. Kingdon Ward on his 1924-25 expedition, is growing well and producing self-sown seedlings at Bodnant, and may prove the easiest of all.

P. Mooreana is the best species of the capitata series, and is one of the most valuable Primulas for garden decoration. Under rational treatment it will succeed in most semi-shaded positions and give a constant succession of its beautiful violet flowers from July until November.

The muscarioides group are chiefly Alpine meadow plants, and should be gr fairly open positions. They form a crown which is dependent on a comp slender root-system to hold it in positi it is advisable to place all young p their flowering positions not later t end of July, so that they become anchored before the resting crow formed. Even with this precaution t frequently lifted by severe frosts, a well to examine them occasionally du winter and make firm any loose cro they will perish with the cold, dry P. atricapilla, P. cernua, and P. defi three of the best and most reliable P. Littoniana belongs to this series, a succeed under similar conditions.

The Cortusoides series are definitely land Primulas, and a shaded bank f congenial home for them. Perhaps t known species are P. Veitchii, P. genses and its variety Hapala. species are so closely related that t often confused. They may, however, tinguished by the hairs on the under the leaves. The leaves of P. Veitchii most densely hairy. P. lichiangenses next, and the variety Hapala has th hairy leaves. The flowers of Hapala also have an orange eye.

Of the Geranioides group, belonging same series, P. latisecta will proba found the most reliable. This speci a creeping rhizome and quickly forms mass. Most of the species belonging Cortusoides series will winter much on a gently sloping woodland bank th will on the flat.

I will mention only one more grou Bullatæ, which is represented in gard Primula Forrestii and P. redolens. are of comparatively easy culture if th be given a sunny position in a wall or the crevice of a vertical cliff in th garden, but any attempt to grow th the flat will usually result in failure, f will succumb to winter damp.

There are many other fine Primulas are well worth growing, but being of more difficult culture they are, conseq outside the intention of these notes, think that I have mentioned suffici show that every amateur may indulge cult of the Primula, for, no matte limited are the possibilities of his g amongst the wide range of species h find some that he may cultivate with chance of success. I would, however, emphasise the importance of planti Primulas in their flowering positions as in the late summer as possible, so that is no possibility of root injury predis the plants to rotting during the winter

Primula enthusiasts should also b mind that many species are biennials, others are doubtfully perennial, or are lived, and to keep a representative coll in good health constant renewal from is very necessary. This is, however, a paratively easy matter from freshly ga seeds, and if the best forms are m specially for seeds, growers may enjo added interest of selective breeding.

Growing Melons in Frames

As pits and frames are now mostly cleared of the stocks of bedding plants which have occupied them for some months, it becomes necessary for those who are anxious to turn the resources at command to the best account to consider to what use the appliances can be most profitably put until again wanted for winter protection. Tomatoes and Cucumbers are often grown with great success, and are highly appreciated during the summer months, but I suggest that an increased portion of the space afforded by the disused pits and frames should be devoted to Melons. Many growers think that Melons are very difficult of cultivation, and cannot be had in perfection without the aid of an efficient heated structure; but although somewhat exacting in their requirements, when the cultivator has become acquainted with these peculiarities, the production of good crops of fine quality presents no difficulty. A high temperature and abundant atmospheric moisture are undoubtedly essential factors in the culture of these fruits, but these can be easily obtained in unheated structures during the summer months by a careful utilisation of sun-heat and judicious use of water.

Melons require for their successful cultivation a rather strong and not over-rich soil. Almost any ordinary turfy loam will, however, be suitable, and very little in the way of rotten manure should be added. With too rich a soil the growth will be unduly luxuriant. There are two courses open in making up the beds, one to form under each light a substantial mound of soil, and the other to form a ridge along the centre of the frame, which has decided advantages. The soil should be moderately moist and made rather firm, and on the formation of the bed, the frame should be shut up quite close for a day or two to ensure the mass becoming thoroughly warmed. The ridge of soil may be added to at intervals, as the roots make their appearance at the sides.

For frame culture, varieties that are hardy in constitution and free setting, as well as of good quality, should be selected. Melons of the Cantaloup type, so largely grown in the South of France, may also be grown under the same conditions. Two plants will be required for each light, and on planting out it may be necessary to slightly screen them from the full rays of the sun for a day or two, but when established they will stand full exposure. A temperature ranging between 75 degs. and 80 degs. during the day will be the most suitable, but early closing of the frames should be practised, to bottle up sun-heat. If the plants and all surfaces of the structure are well sprinkled with tepid water before closing, this may be done early enough for the temperature to rise to 90 degs. or 95 degs. without any risk of injury to the foliage.

When the plants are well established and growing freely, they should be stopped, to induce the formation of several shoots, which should stretch over the bed and be allowed to grow unchecked until they reach the sides. They must then be stopped, and as the result of this, fruit producing laterals will appear along their whole length. During the flowering period, rather more buoyant conditions should be maintained, and artificial pollenisation should be carried out so soon as four or five female flowers are expanded at the same time on one plant. Each plant will be able to bring four or five fruits to maturity, and so far as practicable these should be evenly distributed over the plant. The laterals bearing fruit should be allowed to grow unchecked, but others will require some amount of stopping to prevent overcrowding. It is good practice to give the bed a thorough watering at the time that the fruit-bearing flowers are expanding, and then discontinue the use of the watering can until the fruits have attained the size of a pigeon's egg. An excess of moisture previous to the fruits reaching this size frequently causes them to turn yellow and ultimately decay. It is a good plan to place a piece of earthenware tile under them at an early stage of growth, and to raise them above the foliage on approaching maturity. As the fruits begin to ripen the soil should be kept rather dry, but sufficient water must be given to enable them to finish completely.

W. Auton.

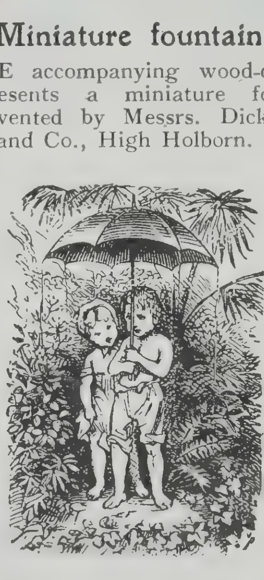
Fifty Years Ago

Miniature fountains

The accompanying wood-cut represents a miniature fountain invented by Messrs. Dick Radclyffe and Co., High Holborn. It has been shown on several occasions at horticultural shows and has been greatly admired. It is well adapted for small ferneries, conservatories, or rock works in the open air.



A simple frame

With a trifling cost from a good size water-barrel can be made a frame just to keep the cold out for the winter and to cultivate one Melon or Cucumber in the summer. Take out six spars of wood (if a good-sized barrel) and put in their place glass in a framework. The frame, with a little trouble, you could make yourself, and for a few shillings buy the glass.—July 12th, 1879.

Border of herbaceous plants

Reply to "L. V."

It is evident that the border requires rearranging, deep digging, and so forth, and this work could be taken in hand any time in September. You say nothing about the class of soil or its depth, but with Michaelmas Daisies 8 feet high the soil cannot be bad. Any bulbous plants could be lifted earlier—say July—and set aside for future replanting. We think it best that you clear the entire bed, trenching the soil, clearing out any rooting weeds, and manuring freely. do this the planting can be done easily. You cannot do better than ar the plants in groups or colonies, as i way a good effect is secured. In the dr tion, the bulbous Irises, Daffodils, T Crown Imperials, Lilium candidum, L. ceum, Alstrœmerias, and such like d tremely well. The Tulips would r annual lifting to do them justice. I background, if you desired tall subje correspond with your Michaelmas D Sunflowers, Kniphofias, Hollyhocks, conias, Delphiniums, and other showy should find a place. If you arrange Larkspur—say, three, five, or more pla to form a group having a ground ar planting time, not less than 3 feet a you will obtain a spread of leafage d this size when in full growth, and a some flowering withal. Taking this spur group as an example, and with a space allowed for full development, you on each side of it, and quite 3 feet neare front, arrange groups of herbaceous Pæ in red or crimson, with Emperor o Watkin Daffodils appearing in spring tween the Pæonies, and filling up the space with a white Campanula—C. carp alba, a mass of 4 feet across. If you f this idea generally you could in like ma employ many of the tall growing Lilie speciosum vars., colchicum, testaceum, didum, tigrinum, umbellatum, Martigon others, in conjunction with tall Rudbec Asters in variety as Pyrethrums, L Phloxes, Incarvillea, Pentstemons, Eri speciosus, with dwarf Phloxes, Campar dwarf Irises, I. pumila, etc., Aubri Megaseas, and many more appearing in masses in the front.

Roses on poles, the red and white pere Pea, and other effective subjects as Cl tises, could also appear in moderate nun throughout the border. We see no occ for dividing the border with stones, thou some extent you could employ these wit dwarfer plants near the front in such a that no formal arrangement should a continuously, and that the presence o stones was intended to assist the dw subjects generally to a greater inform and picturesqueness by raising the p more prominently, so that they event clothe the sides of the stones. It would good plan to roughly sketch the border, with the assistance of a catalogue grou plants.

Raised beds

Raised beds are seldom seen in m gardens, but in years gone by were common, and if well planted were a pleasing feature. I remember three were worth noting. One had alternate p of Plumbago capensis and Solanum jas oides just inside the paths growing ren ably well, flowering profusely, and har nearly to the ground. The remainder o bed was filled with a few tall plants of H trope and the Lemon-scented Eucaly with dwarfer Heliotrope beneath. In st contrast to this bed of pleasing soft sh was one of Fuchsias, the outer rim pla with General Roberts and Wave of both of a pendant nature, whilst Fuchsias in several varieties filled the mainder of the bed. The contrast in co of the different varieties, both in sepals corolla, was startling, but in no way dist ful. Yet another bed was, perhaps, more startling, with plants of Tropæ canariensis, Maurandya Barclayana, a centre of Veronica Andersonii variegat study in purple and gold.

saving

ny Alpine and other plants are ripening
seeds fast, and these should be harvested
perfectly dry and stored in a dry place.
he case of Primulas, Auriculas,
ndias, Conandron ramondioides,
nopsis, etc., they should be sown as soon
ssible. When only a small quantity of
s required from a batch of plants the
sary heads should be marked and the
emoved.

nberries

n out the strong growths of the current
o three or five of the best, place stakes
se to prevent swaying by rough winds,
pply weekly doses of liquid-manure to
carrying heavy crops.

Trained fruit trees in the open

Cut away all superfluous growth to within five or six buds of their base and thus give sunshine and air admittance to those buds which are now being built up to supply next season's fruit. Examine all such trees and make the final thinning of their fruits, care being taken to clear away all damaged or distorted examples, as they only rob the trees.

Netting

Continue to net all fruits as colouring commences, and use the nets from the earliest batch of Strawberries for late dessert Gooseberries. Here it is often necessary to net Green Peas or to suffer considerable loss.

Melons

Plants swelling their fruits must be assisted with frequent applications of liquid-manure. This, however, as in the case of water, must be given with discretion, and should not touch the base of the stem, or canker is likely to set in, resulting in the early death of the plant. Few things require more care in this matter than Melons.

Autumn-sown Onions

Bend over the growths of those not already ripened and so prepare them for lifting. The remainder should be pulled and laid on their sides to dry for a few days before storing in a cool, airy shed. The same applies to the mild Potato Onion.

Celery

If leaf miner proves troublesome spray the plants with Quassia Extract and this disfiguring pest will disappear.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Harvesting Shallots

It is advisable to keep a watch on the Shallot bed, for as soon as the crop is ripe it ought to be gathered and laid out thinly on a hard surface and in full sunshine to properly mature. If left in the ground and a rainy spell sets in, the bulbs, immediately they are ripe, again send out roots, and, in so doing, spoil, to some extent, the quality and keeping properties of the crop.

Planting Leeks

It is now advisable to have full breadths of this useful winter vegetable planted, making certain that the site selected has been well worked and generously treated as regards manure. Plant in drills 3 inches deep drawn with a hoe, taking care not to "hang" the plants. In this connection it is advisable, instead of trying to firm them in the soil, merely to make deep holes with the dibber and drop a plant into each. A very small quantity of loose soil may be trickled into the holes, if desired, or a little water can be given, and this will wash in sufficient fine earth to give the plants a start.

Vegetable Marrows

Dryness at the roots is quickly resented by this subject, so during dry spells copious drenchings twice a week will prove very beneficial. After a number of fruits are set and swelling, an occasional soaking of liquid-manure will encourage the plants to give of their best. Avoid overcrowding of the shoots by vigorously thinning out the growths.

Layering Border Carnations

This is a tedious and back-breaking job, but one that is an essential item in the culture of this esteemed plant. It is a good plan to do the work betimes, just as the different varieties become ready, as this greatly lessens the tedium of the operation.

Border Chrysanthemums

The staking and tying of these must not be neglected much longer or the stems will get bent over, if not actually broken, and there will be considerable difficulty in getting them neatly trained. Prevent overcrowding by cutting away all unnecessary shoots, nothing ever being made by permitting a mass of shoots where there is only space for a few.

Dahlias

These grow rapidly now, and a frequent overhaul is necessary, removing all unnecessary shoots and securely but loosely tying in those retained. The Dahlia delights in moisture at the roots, so in dry weather do not forget this fact. Should there be any lack of vigour an occasional soaking of liquid-manure will materially help to strengthen these plants.

The Rose garden

Most beneficial to all classes of Roses is the frequent stirring of the surface soil with the Dutch hoe. Incidentally, it destroys weeds, and so materially adds to the beauty of the beds. When suckers are discovered do not cut them, but pull each one out by the socket and so prevent, to a considerable extent, others from springing from the base, as happens when cutting is practised. A soaking of water during dry weather will be greatly appreciated by the bushes. Remove spent blooms and thin the buds drastically whenever necessary.

Pansies and Violas

The season of beauty may be considerably extended if spent blooms and seed-pods are removed at frequent intervals. Any straggly growth may, with advantage, be cut back, and also any weeds present removed. If the soil can be lightly stirred between the plants with a hand-fork and then a mulch of very rotten manure worked in under the plants much benefit will result, the plants again flowering freely, while, later on, numerous sturdy cuttings will spring up in the centres of the plants.

Sweet Peas

Water, train, and tie these, as necessary. Dryness at the roots is most injurious to this plant, so every care must be taken to see that this state is never reached. On dry, hot soils a generous mulch on both sides of the rows adds materially to the welfare of the plants, checking evaporation, and helping to maintain a cool, rich medium favourable to the production of fine flowers. Pick off any seed-pods that appear, and cut away shoots that threaten to produce overcrowding.

Cyclamens

These should be sprayed overhead twice daily, while the soil in the pots must never be permitted to get actually dry, at the same time taking care not to keep it constantly saturated by too frequent applications of water.

Calceolarias and Cinerarias

Both of these must be provided with cool, shady quarters all through the summer and early autumn, while watering must never be neglected. A dry, warm atmosphere and soil will invariably induce attacks of Green Fly and other noxious vermin, and if these get a serious hold the plants are doomed.

C. BLAIR.

Preston House Gardens, Linlithgow.

Notes from a Cornish Garden

THE children have a couple of little gardens in the upper compartment of the wall garden. To one of them it is merely a thing to show to visitors, but to the other a real interest. For she is a picker-up of unconsidered trifles, chiefly valueless, and spends some of her scanty pocket-money at a shop called Woolworths, where it appears one can get bulbs, etc., which really grow, for an almost infinitesimal sum. Assuredly Mr. Woolworth should be knighted or canonised as the children's saint from the amount of pleasure he gives.

To me these gardens are a refuge from the gardener and his boy, whose custom it is to knock over the labels and destroy the plants they do not know in the other borders. So that though I have to do most of the weeding, I can with comparative safety put odds and ends in them for which no other place is available. At the moment they contain a group of Aquilegias—formosa x the long-spurred—the seed of which was sent me by my friend, Mr. George Fraser, of Ucluelet, British Columbia. And beautiful things they are, some being mauve and white, though the majority show a lot of red in the sepals, with petals which are cream-coloured. As a rule I find the Viburnums rather invasive for this garden and have had to abolish several Chinese species which have threatened to crowd out their choice neighbours. Viburnum Carlesii is an exception, beautiful in flower and sweetly scented, and V. rhytidophyllum is very handsome just now, a shapely bush growing in poor clay soil near the upper pond, with its large flowers well distributed all over it. V. tomentosum var. Mariesii is particularly fine, a great spreading bush with multitudes of pure white flowers on its horizontal branches. Moreover, it layers itself freely, though it appears that rabbits will eat the layers when separated and planted out.

The first of the wild Roses are in bloom, R. omeiensis and R. Hugonis, the latter creamy-yellow, the former almost white, with pretty foliage, the whole of the leaf-stem being red, and a graceful arching habit which renders it very attractive.

A stretch of Primula helodoxa on a north bank among the Ferns is quite delightful, nor have the rabbits found it yet. A damper place would make it grow taller, but near the stream grow many gigantic weeds, and since labour is non-existent here it would not hold its own. P. pulverulenta, indeed, does so to a certain extent, and I was pleased to see a self-sown seedling of the fragile little P. Cockburniana among the grass the other day. One plant of P. Reidii, minute, hairy-leaved, with large pure white flowers, is in bloom on the steep north bank beside the drive, which apparently suits it, as one of the plants has been there for three years. It does not suit P. Agleniana nor P. Omphalogramma, which seems to require a richer diet, for they live but do not flower. P. Agleniana has got over being divided and is looking well, but so far only one plant is flowering. Its great white flowers, with their green centres, are exquisite. I am very fond of a green centre or green spotting in a flower. Some of the Lilies have it, such as L. Farreri, and some varieties of Rhododendrons Aucklandii and decorum, whilst R. Augustinii occasionally has green spotting. How disappointing in this respect are some of one's purchases at shows. During the last two or three years I have bought Rhododendrons Mrs. de la Mare and Mrs. Lindsay Smith, both because of this green spotting, and a pure yellow variety of R. cinnabarinum. The last turned out very ordinary and the first two have brown spots, the abnormal colours being probably due to forcing. And all the time there is in the garden one of my own Hybrids, Brachycarpum x discolor, of the most delicate pale pink and with the required green spots. And this is, indeed, a fine flower, for it has 15 seven-lobed bells, 2 inches by 3½ inches, in a tall conical truss, and yet retains the charming colouring and refinement of R. brachycarpum. If circumstances had permitted I would have taken it to London, a candidate for a F.C.C., but as they did not, I can only hope that someone else who has had a plant will do so for me.

The incomparable Meconopsis Baileyi is flowering here for the first time and is giving us the greatest pleasure. Azure blue, no less, with a circle of yellow stamens, and sometimes four out at once on a stem 2 feet high. Unfortunately, a certain number of the plants are bearing purple flowers and are probably natural Hybrids with M. quintuplinervia. A neighbour to whom I gave plants saw only the last before she went away for a month and was highly indignant thereat, but I hope that some of the real thing may pacify her on her return.

A Himalayan Meconopsis from seed collected by Pradham, probably paniculata, is flowering in the same bed and is pale yellow throughout.

During the winter I had to cut all the lower branches off Davidia involucrata as it was crowding some Rhododendrons planted near it. However, it does not seem to have bled, and is now hanging out many of its large white bracts among the green leaves. A damp place with a north aspect evidently suits it, as it has prospered wonderfully ever since it was moved from the hot sunny spot where it was originally planted. Near it Acer Forrestii, by no means the least ornamental of that pleasant race, is beginning to set its seed and is making a nice little tree about 6 inches in diameter at the base. Its bark is a dark olive-green, with perpendicular lines of a lighter green, and the leaves are dark green with reddish stems.

Forrest's number was 6008, and it is worth a place in any garden, if obtainable.

PETER THE HERMIT.

Summer Show of Brighton Horticultural Society

THE summer show of the Brighton, Hove, and Sussex Horticultural Society was held on July 3rd and 4th in The Dome, Corn Exchange, and Library, at Brighton, and it no doubt suffered somewhat by being held so soon after the Sussex County Agricultural Show, with its large horticultural section, and also by being held during the same week as the show of the National Rose Society at Chelsea. Nevertheless, there were some particularly fine exhibits of Roses from Messrs. Prince, of Oxford, and Frank Cant and Prior's, of Colchester.

In the collection from Oxford, for which first prize was awarded, I Zingari, Angele Pernet, Christine, the "Daily Mail" scented Rose, Mr. Herbert Stevens, Johanna Bridge, Hortulanus Budde, Ivy May, Betty Uprichard, and William Kordes were very finely shown.

Frank Cant's contented themselves with a comparatively small group, but were awarded first prize for cut Roses shown in another class, in which Marcia Stanhope, Mabel Morse, Lady Inchiquin, and Mr. Henry Morse appeared to perfection.

Mr. Frank Woollard, of Brighton, was awarded the third prize for a fine group composed largely of the above-named The same firm also showed an int group of herbaceous plants, the being particularly good.

A. Goatcher and Son, of Wash Sussex, showed a Gold Medal gr Roses, and Mr. Ernest Hicks, of W ford, was awarded a first prize for a f lection in which Lady Inchiquin, I Z and Dainty Bess were particularl shown. Second prize fell to Hazelde Knight, of Lewes, for a good group of

Cheal's showed a Gold Medal gr herbaceous plants arranged in their fa position in front of the great organ Dome. In the centre of the group the a fine collection of Dahlias in many different varieties. Mr. W. A. R. Clif Willingdon, showed some of his fine Pelargoniums, which gained the Medal. A new variety named Will Gem is a deep, rich orange with white

Amongst private growers a first pri awarded to W. H. Vokins, Esq., for goniums (gardener, Mr. W. J. Scott).

A magnificent non-competitive disp fruit came from G. G. A. Nix, Esq., gate, Crawley. The bunches of Grapes Cannon Hall were particularly

Another fine exhibit of fruit came C. B. O. Clarke, Esq., Weston Steyning (gardener, Mr. J. Kidd).

Mr. J. H. Manton, gardener to W. J. Esq., of Haywards Heath, took first pr a fine group of Perpetual Carnations.

Lowe and Gibson, of Crawley Dow up a magnificent collection of Delphi for which the Gold Medal was awarded exhibit was to show the result given b ing one packet of seed which is save 22 leading varieties only.

Balchin's, of Brighton and Hove, fill end of the Corn Exchange with a form den having a central bed filled with Crampel Pelargoniums, and a gro Lilium longiflorum in the middle of On each side of this central bed smalle filled with Tuberous Begonias and vari foliage plants were placed, the Coleus particularly good. From Lye Nurseries, Chesham, Bucks, there charming formal garden with pool artis constructed and planted, which receiv Gold Medal.

Mr. H. Hemsley, of Crawley, made garden display of Alpines on the bench, also received the Gold Medal.

The Misses Davison, Faircroft, With Brighton, put up one of the best colle of cut herbaceous flowers in the clas amateurs. Here various Water Lilies shown, and the blossoms remained well throughout the two days on which the was held.

In the class for table decoration Miss Rhodes, The Firs, Clappers Gate, Barc was awarded first prize for an arrange of Dainty Bess Roses.

In the Trade section W. Miles and were awarded a medal for a display of f and flowering plants, in which Hydra and Gloxinias figured.

Mr. S. Miller, of Newport, Isle of W ran away with the Silver Challenge Cu a collection of Sweet Peas. Avalanch pure white; Gleneagles, a lavender-a Grenadier, a geranium-scarlet; Mrs. Searles, a deep salmon-pink; What J pale yellow; Sunkist, a cream Picotee; Youth, another Picotee, were splen shown amongst many other varieties.

Mr. Arthur Pratt, of Preston Brighton, had an exhibit of flowers in Corn Exchange to draw attention to Florists' Telegraph Delivery Association ing up florists all over the world.

seased

G.).—Your Iris is affected with Iris Spot, which is caused by the fungus porium gracile. If only a few plants ected it would be wise to burn them. lants growing near should be sprayed ulphide of potassium. If you desire to try and control the disease you should cut off and burn the discoloured foliage, and keep the plants sprayed with the sulphide of potassium, 1 oz. in 2 gallons of water. When the rhizomes begin to make their new growths a thorough drenching with Cheshunt Compound would keep them. If the plants show any sign of the trouble next year repeat the Cheshunt Compound solution and spray the foliage with the sulphide of potassium solution indicated above.

Sweet Peas dying off

I should be much obliged if you could tell me the cause of some of my Sweet Peas dying off, and have enclosed two for inspection. The method of cultivation employed is to sow the seed in 48-pots in October, place in a cool frame, and during October or November dig out a trench 2 feet wide and 2 feet deep, half fill the trench with leaves, chiefly Oak and Beech, put a thin layer of horse manure and fill up trench with soil, and then in the spring, about the third week in March, shake out the Peas and plant about 1 foot apart in two rows.

S. E. Hᴀʀᴛʟᴇʏ.

[Your Sweet Peas are attacked by a fungus which causes Black Rot. The organism concerned is Thielavia basicola, which attacks many kinds of garden plants. Your method of culture appears to be correct, and, of course, we cannot say actually when infection occurred, because it may have happened at any period from the date of sowing. Take up and burn all the plants that are affected; they could at best only make a partial recovery, and diseased plants are a source of danger to healthy ones. The healthy plants should be given a thorough soaking with Cheshunt Compound. When sowing your Sweet Pea seed another year make sure that they start well by sowing in sterilised soil. Soil for the purpose could be baked, or, if this is impossible, you could use the chemical formaldehyde for the purpose. Take 6 gallons and 1 pint of water, and add 1 pint of formaldehyde; stir well, and then add enough of the solution to the potting soil to well wet it. Cover with wet bags for 48 hours, then air the soil, turning it each few days to allow the fumes to escape. Soil treated with formaldehyde should not be used as a potting medium for at least a month; six weeks is safer. After preparing the flowering quarters for your Peas next year give a soaking with Cheshunt Compound just prior to planting. Cheshunt Compound is from time to time advertised in our pages, and only requires water to be ready for use. Cheshunt Compound can be used either prior to planting or direct to plants without harming them.]

Muscari (Grape Hyacinth) seed

(P. B. H., Bournemouth).—These come freely from seed, which should be sown in spring in a light, gritty compost in a cold frame. Flowering plants are produced in three or four years from seeds, but the bulbs are so cheap that raising from seed is scarcely worth while unless one wishes to increase a very special kind.

GREENHOUSE

Geranium trouble

(“ Cairndowan ”).—The trouble, we doubt not, was caused by the addition of the stable manure to the compost for the Geraniums. These plants require none of this material, as it only causes soft, long-jointed growth and few and inferior flowers. The best compost for the Zonal Pelargonium (Geranium) is made from three parts turfy loam, two parts leaf-mould, and 1 part coarse sand. This is improved by adding a 6-inch potful of bone-meal and a 5-inch potful of Thomson’s Vine and plant manure to each barrow-load of the other ingredients. Mix thoroughly and press quite firmly round the roots.

Mystery Lily of the East

(L. D.).—The Latin name of this curious Lily is “ Sauromatum guttatum ” syn. Arum venosum. It is a native of the Himalaya and is increased by offsets from the older tubers. To obtain the most satisfactory results this species should be grown in a warm greenhouse in a compost of light, rich, sandy loam, peat, and leaf-soil. The roots must also be kept well supplied with water when in growth. The greenish spathes, washed with yellow inside and irregularly blotched with deep purple, appear during May and June. The tubers, instead of being grown in a greenhouse as recommended, are often placed in fancy bowls, or even on the mantel-shelf, without any water whatever. If the temperature is high enough (60 degs. to 70 degs.) growth commences, and the nourishment stored up in the tuber is sufficient to produce the flower-spathes without further attention. Plants so treated are of little use after flowering.

Lilium auratum seed

(Rev. R. F. Reeves).—It is just possible that your Lily may ripen its seed if kept in the greenhouse and given every care in the matter of watering and airing, and shade from midday sun. The seed should be sown as soon as it is ripe in well-drained pots or pans of sandy soil. Cover the seeds very thinly with sand, and raise in a cool frame or greenhouse. You are probably aware that this and many other Lilies may be increased by scales taken off the bulbs and dibbled into pots of sandy soil, this being a quicker method of propagation than that of raising them from seeds.

Geranium Leaf Spot

(T. G. L.).—We have examined your Ivy-leaved Pelargonium and find that the only organism present likely to cause trouble is a large number of Red Spider. This pest attacks a very wide range of plants and causes a lot of foliage troubles. The actual spotting of the foliage is only indirectly connected with the Red Spider, but there is no fungus present which should cause you any bother. The best method of control for the spider attack will be to keep the plants well syringed with clear water, driving the water well beneath the foliage and between the pots. A watering with sulphate of potash, repeated twice at intervals of seven days, would help you to keep the foliage healthy. The strength of the sulphate of potash solution should be 1 oz. to 2 gallons of water. Well stir before using. Keep the Pelargoniums well aired if you will have them under glass.

TREES AND SHRUBS

Spiræas delay flowering

(H. C. Gaye).—The Spiræa appears to be S. Van Houttei, a hybrid between S. trilobata and S. cantoniensis, the leaves of the true S. cantoniensis being lozenge-shaped, which these are not. We could have been more sure had we seen flowers. S. Van

Houttei is one of the finest white-flowered Spiræas in cultivation, and we think it is only a matter of time before your plant blooms. Syringa japonica, cannot say with certainty without flowers, but probably the true thing.

CHRYSANTHEMUMS

Leaf Miner on Chrysanthemum

(W. Ken).—Your plants are being attacked by a Leaf Miner similar to, but not the same as, the Leaf Miner so commonly found on Celery. Please see reply to F. Holland in this issue. Your specimens arrived in a dried-up condition and all the maggots were dead. If you would like to send us some fresh specimens, plenty of them, packed in a small tin box, we would endeavour to breed them through to the adult stage and get the actual culprit named for you. You realise, of course, that it will be next spring before you obtain a reply, and only then if we are successful in getting the adults through. If the fly happens to be a double-brooded one we may get the flies out before the autumn.

ROSES

Rose Leaf-rolling Sawfly

(E. Williamson).—The Rose shoots you send for examination are affected with Leaf-rolling Sawfly (Blennocampa pusilla). The Sawfly in question occurs frequently on wild Roses, and is not uncommon on cultivated Roses. It appears that for some reason or the other the pest is extremely common this year, and we have noticed that hardly a Rose garden in the country is free. The adult Sawfly appears in May and June. The colour is black and shiny, the legs black with whitish knees, wings dusky and iridescent. Eggs are laid on the foliage. The caterpillars need no description from us, because if you unroll the affected foliage you will find the caterpillars within. When the caterpillars are fully fed they drop to the soil, enter, and form cocoons in which they remain as caterpillars until the following February or March. Pupation then takes place and the adults emerge in May and June. Hand-pick and burn all the affected leaves. At the end of next March spread evenly 2 ozs. of naphthalene per square yard of soil and then fork in the material as deeply as you can without disturbing the roots. Watch carefully for the reappearance of the pest next year, and deal with it by hand-picking and burning if necessary.

VEGETABLES

How and when to make an Asparagus bed

I wish to make an Asparagus bed and should be glad to know what is the best time to prepare the bed, and how to do it; also the right time to put in the plants. I believe two-year-old plants are the best. How long after planting would a crop be ready to cut?

A. WELLS.

[The ground for Asparagus must be thoroughly prepared, and while some soils are better than others, the best is a good, deep, friable loam with a porous subsoil. Good drainage is absolutely essential, therefore, unless the land is drained naturally or is of a specially heavy nature, land drains should be laid along the whole length of the beds, with a slight fall to the exit. The ground should be trenched 3 feet deep in the autumn, working in a good quantity of well rotted manure, burnt earth, and mortar rubbish, and on heavy land the bed should be raised to 1 foot above the general level of the ground. At the latter end of March fork over the bed, which should be 5 feet in width, and place a neat but stout stake at each corner. If other beds are required alongside, alleys 2 feet wide should be left between them. The first week in April is a very suitable time for planting, choosing dull, damp weather, and the shorter the time taken between lifting and replanting the better. Such a bed will accommodate 3 rows of plants at 2 feet apart all ways. Having lined out the bed, proceed as follows. Remove the soil at each station, leaving the centre of each hole slightly higher than the sides, and place the plant carefully thereon, or the roots pointing slightly downwards, and finish off with 3 inches of fine soil, making the whole tolerably firm. Never cut the heads until the second year after planting.]

Asparagus growing

(Young Gardener).—All you can do at the present time to established beds of Asparagus is to apply plenty of moisture, with an occasional dose of diluted manure water, or, if possible, give it a mulch of farmyard manure. If the growths become tall and heavy and require the support of stakes, these should also be given. There is nothing further that can be done except to keep the plants free from weeds until autumn when, following the ripening of the growths, they should be cut away at 4 inches from the ground.

Asparagus "Caterpillars"

(Charles Barrington).—The specimens sent for examination are the larvæ of the Asparagus Beetle (Crioceris Asparagi). The adults hibernate during the winter in garden rubbish and emerge about the end of April. Eggs are laid on the stalks of the Asparagus. After about a week the larvæ hatch and begin to feed. After feeding for 14 or 15 days the larvæ are fully fed and drop to the soil, where they form a cell and pupate. Ten days later at the outside, another generation of beetles emerge, and the life-history is repeated. Clear up all rubbish near to the beds during winter. When growth commences in spring all growths should be kept cut; that big enough for the kitchen should be used for that purpose, but the small material should be destroyed. By so doing, the beetles of the hibernating generation are forced to lay their eggs on the pushing growths, and these are constantly being removed and used or destroyed. This plan breaks down badly if any growths are allowed to remain. At this period of the year all you can do is to keep the foliage dusted with fresh air-slaked lime early in the morning. This treatment will kill the larvæ.

Growing Seakale

(Young Gardener).—The flower stems should be removed at once down to within 4 inches or 5 inches of their base. Seakale requires good ground and generous treatment, and otherwise is by no means a difficult crop to grow. The plants you refer to are apparently old ones, and apart from keeping them clean and feeding them, there is nothing further which you can do at present. During the winter you might lift a few plants and cut off their roots, selecting a few of the straightest, and after cutting them into lengths of about 5 inches, stand them upright in boxes of sand in a cool, frost-proof shed. By April the thick end will have made slight growth, and the roots may then be planted out on good land at 18 inches apart. In this way you may renew your stock.

Tomatoes for examination

(F. T.).—The Tomatoes are attacked by the fungus known as Black Rot, a rather common disease. A thorough system of ventilation is the best means of keeping Black Rot at bay in houses, a little air being left on all night, with an increase of fireheat to keep up the temperature. Sulphide of potassium at the rate of ½ oz. to 1 gallon of water is also useful as a preventive measure. It sh
sprayed upon the plants as soon as th
fruits have set, and repeated if n
Bordeaux mixture is also useful in
ing this disease. Too much moistu
ing about the plants is often respon
this trouble.

Celery Leaf Miner

My Celery is attacked very ba
maggot. What would you recomme
rid of this pest, also the cause? I
made its appearance I had dusted w
also sprayed, every other day, wi
water, and have sprayed with a nic
ordinary strength and then double
but without success. I might add
the last 10 years the ground has bee
manured (cow manure). Would this
bring this about?

F. Ho

WALTER BLOM & SON, LTD. (late of Overveen), Hillegom, Holland

the plants, they should be sprayed with clean water to prevent any surplus lime sulphur remaining on the plants. A little air should be given and the plants shaded from hot sun if necessary. This treatment will cure plants where the disease has not reached the canker form on leaf and main stems. When the disease has reached the advanced stage nothing short of taking out the affected plants and burning them will save the rest. Healthy plants growing near should be sprayed as a preventative. You should remember that lime sulphur solution when made up does not keep in good condition long, so that it will be necessary to make up a fresh solution each time it is required. Some varieties, both of Cucumber and Melon, are markedly resistant to this disease, and we imagine this explains why only one of your varieties is affected. After a house has had this disease a thorough clean-out is essential, because the organism can exist between two crops as a saprophyte on any organic matter lying about the house.

Vine trouble

(E. G.).—Your Vine foliage is attacked by Vine Mite and also by Red Spider. You can control the latter by using plenty of water for damping down and syringing; make sure also that the roots of the Vine do not need more water than you are giving them. The Vine Mite cannot be successfully controlled at this period of the year, but the dormant Vines should be sprayed next spring with lime sulphur at winter strength, as near to the breaking of the buds as is possible. The vinery should be fumigated with naphthalene when all your Grapes are cut and the foliage shows signs of beginning to crop this autumn. Give the border a dressing of sulphate of potash at the rate of 1 oz. per square yard at once and repeat the dressing next spring.

Nectarine leaf curl

(P. C. M.).—Your Nectarine is affected with Peach Leaf Curl, caused by the fungus Exoascus deformans, a disease which attacks Peaches, Nectarines, and, less frequently, Almonds. The disease makes its appearance each spring and is always most prevalent in cold, dry weather such as has been experienced this year. The foliage produced later is generally free from the disease. Pick off and burn all the affected leaves, following this treatment up by spraying just before the buds begin to push next spring, with copper sulphate, 9¾ ozs.; sodium carbonate, 11 ozs.; and water, 3 gallons. Sodium carbonate is common washing soda. The copper sulphate and soda are dissolved separately, each in 1½ gallons of water. When completely dissolved the two are mixed together. Wooden vessels should be used for mixing the materials. The solution does not keep long after it is made up. In bad cases the spraying should be repeated after an interval of a few days, covering the whole of the tree with the solution. Persons who are troubled with this disease are frequently led to believe that the disease has been cured after having picked off the affected foliage because the summer foliage is free from the disease. The Leaf Curl reappears each spring, and the only control is to spray as above.

Morello Cherries dropping

(C. W. Cozens).—If you pick up some more of the Morello Cherries and open them with a knife, cutting right through the stone, you will find the cause of dropping. The seed within the forming "stone" has not developed. This is due to imperfect fertilisation. Imperfect fertilisation can be caused in many ways: sterile varieties, frost, lack of phosphate. As the Morello Cherry is a self-fertile variety, we think that your trouble was due to frost during the flowering period. If you have not given any mineral manures (potash and phosphate) of late you should apply an equal mixture of a good grade basic slag and kainit at the rate of 8 ozs. per square yard. If your soil is on the heavy side omit the kainit and give sulphate of potash in spring at 1 oz. per square yard. The wind had nothing to do with the fruit dropping; it would have dropped in any case.

MISCELLANEOUS

Destroying moles

(H. Goodman).—It is of no use to try and trap moles in loose and newly cultivated ground unless you are an expert at the job, but if you could find their main run, where they enter, even though you have to dig low down for it, you would secure them easily with the ordinary spring trap. In loose ground the best method is to cut up cooked bacon rind or bits of meat, dip them in rat poison, and place them in the runs the moles are known to frequent. In a short time their activities will cease. Our issue of last week contained details and illustration (page 473) of a mole trap which is extremely effective.

Ridding lawns of Plantains

Will you kindly tell me if there is any effective way of getting rid of Plantains? I am trying to get much neglected lawns into good order and have this very difficult problem to face. I have used weed killer and they have grown again. A. M. H.
Lincs.

[Place a small pinch of lawn sand—from a reliable firm—over the crown of each plant whilst the dew is upon them, and repeat, if necessary, upon very strong old roots a second time. This should rid them from your lawn. The only other satisfactory method is weeding them out with the help of one of the specially made hand forks.]

NEWS IN ADVERTISEMEN

Slug Mort

We understand that the very efficie remedy known as Slug Mort has bee out in many quarters with excellent and the Company have recently been fa by an order for a supply to the Royal at Windsor.

"Beauty from Bulbs"*

Around the plot and counter-plot tha the hybridising of a unique bulb spun his immortal tale of La Noire, but for all our absorption in th of patience, devotion, jealousy, hate, d and triumph, it is to bulbs literatur another plane we turn for instructio this most popular form of gardening.

We shall be busying ourselves soo the catalogues, for the time is near we must plan our bulbs planting sche next spring.

A foretaste of these publications is to hand from the enterprising John Sch of New York, but theirs is no ordinar logue of pictures, paragraphs, and pric is an attempt which suggests kinship compilers with Dumas' hero in his to the bulb. It is a bulbs idyll. In a attractive setting of historical detail, cl quotations in poetry and prose, Frago La Belle Jardiniere as frontispiece, more illustrations of bulbs and bulb ga mostly in colour, full descriptions of hundreds of Tulips, Narcissi, Crocus, and miscellaneous bulbs, this is a treat "Beauty from Bulbs" which, betwe embossed covers of green and gold and printing and general embellishment, mises to an uncommon degree the love of its subjects in their natural setting. a rare tribute to the favourite bulbs of A can gardens, and exemplifies once mor commercialism and art can on occasi very happily wedded. A.

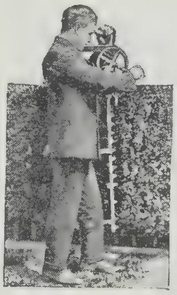
HEDGE CLIPPING
QUICK — EFFICIENT — INEXPENSIVE



THE ALL-BRITISH
"LITTLE WONDER"
HEDGE CLIPPER

is a practical and strong machine that will clip any variety of hedge five to ten times as fast as the hand shears. A better face to the hedge is obtained with much less effort—sides as well as tops.

When used by two men the sides of 9 ft. high hedges can be clipped without scaffolding.

Catalogue gladly sent on request. Free Demonstrations within 35 miles of London. Award of Merit by R.H.S.

Garden Form

LISH gardening is an art that has
eloped with the slow dignity of cen-
es, its beginning being almost as old
constitution. Each generation adds
quota of thought, which is perhaps
criticised by the next. We, to-day,
ost patronising in our disapproval of
comfortable curves and stiff carpet
of the Victorians, and it is difficult
ve that any coming generation will
back to it. But having decided we
y superior, would it not be wise for
dulge in some introspection and ask
s what is our own contribution to
ient art? Our children will answer,
tions." Up and down the country
l gardens of the well-to-do being
into museums of rare plants, and if
ze were to become universal the out-
uld be depressing. Luckily this is
there are still many who value form
our before rarity, and who will not
balance of their garden to find room
e plants than it can hold. The test

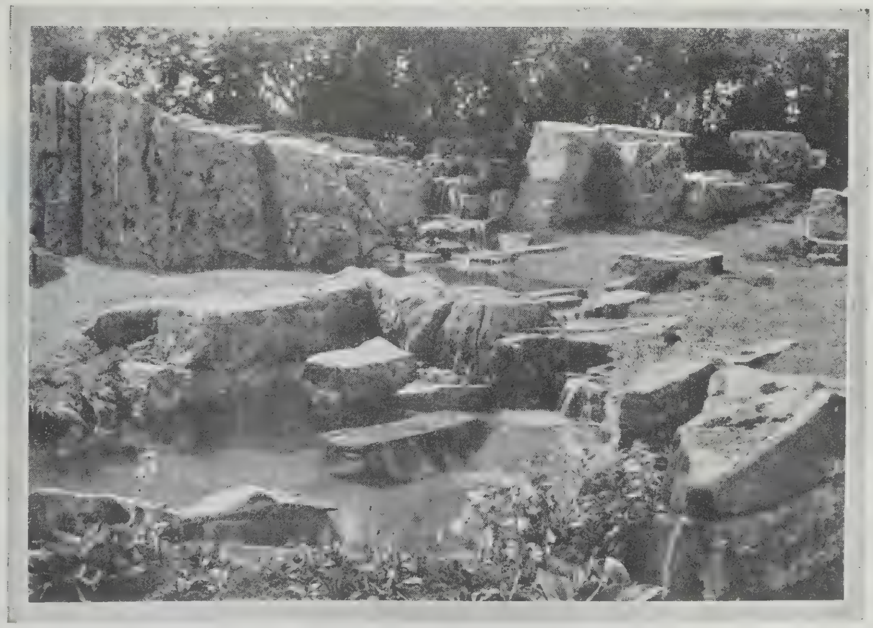
ossessed by
side the syn-
dicate. The next step is a friendly exchange of visits with influential members of the council, when Mr. X, being wise, keeps the conversation about plants in his own garden or plants he knows—his reputation is quickly established as a plantsman, and he is deemed worthy of being given a voice in horticultural councils. His knowledge of garden lore, as understood by our forefathers, is probably small, and his artistic taste and knowledge of garden form and proportion are probably nil. It is hardly surprising that we are wandering into the wilderness with such mentalities as these at the helm to guide our premier horticultural society.

If the architectural profession fell under the domination of a similar school of thought, Regent Street, instead of being a stately line of commercial buildings, would be a museum of architectural rarities. We can picture the managing director of Swan and Edgar showing us the beauties of his building: "This is rare; it is a window from the Doge's Palace in Venice. That next to it is a harem window from the late Tippoo Sultan's Palace; very rare. And that—ah, that's a gem; it is the original window through which Sir Walter Raleigh first blew tobacco smoke in London; it has not yet been reproduced in any building in the country." This would suffice for him to be invited to judge rock gardens at Chelsea!

Let us have our collection enthusiasts; they have their place in horticulture, and an important one, for it is they who first try new plants, and when they cease to be rare society discards them as dull or admits them into cultivation as worth keeping; but let us also have the true garden lover with artistic taste enough to appreciate form and line and colour. The two mentalities are seldom found in the same person, and it is only the latter type who can be relied on to judge a plant solely for its garden value. Their influence is needed to correct the present-day tendency to museum-ise our gardens.



A portion of the much discussed rock garden by Mr. Gavin Jones at Chelsea this year

Constructed on bold and original lines in surface weathered granite from the gigantic screes of the Snowdon Range; it is a remarkable study in rock mass and a magnificent replica of natural effect.

NOTE OF THE WEEK

First Danish woman landscape gardener

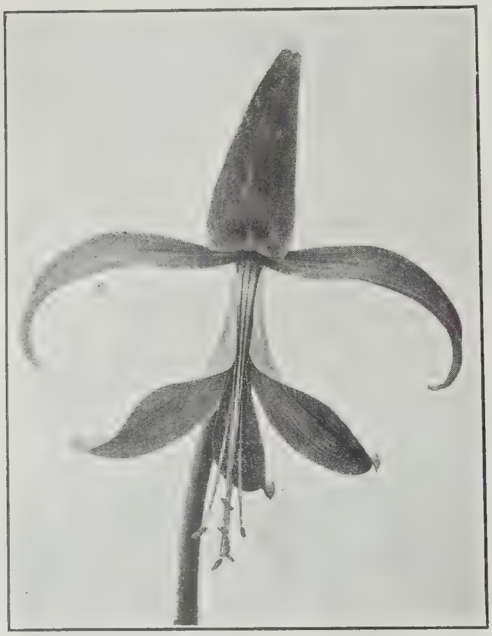
THE first woman to complete the course of work required in Denmark for the diploma of landscape gardener is Mlle. Anka Rasmussen. For the last 15 years she has been studying garden work in order to take the final examinations. The different grades include fruit-growing and plant school-work. Four years are prescribed for the practical work, and another four at an Agricultural High School, at the end of which a three-year course in surveying and levelling must be taken before the final diploma is granted. Miss Rasmussen also worked and studied in Italy, France, and England in order to specialise in the different styles of landscape gardening found in these countries.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Rock gardens at Chelsea

THE criticisms by "S. I. B." on rock gardens in June 29th issue, can only emanate from a biassed and undiscerning mind. Careful examination of his letter and of your Chelsea Show critique seems to point particularly to Mr. Whitelegg's exhibit as the object of his scorn. Much as I esteem him personally, I hold no brief for Mr. Whitelegg, but as a rock builder I speak with knowledge, and I do not hesitate to say that the builder of his exhibits of 1927 and 1929 is the foremost exponent of art in the rock garden to-day.



Sprekelia formosissima (the Scarlet Jacobean Lily)

In your issue of June 1st I gave my opinion of the rock bank this year. On the same page Mr. John Wood gave Colonel Gavin Jones an encouraging pat on the back. I myself praised Colonel Jones highly where I thought praise was due, but I am no whole-hearted admirer of his work. It is too severe. Colonel Jones, I believe, gained much of his knowledge of rock construction in the Himalayas during years of foreign service, and it would seem that the frowning peaks of Northern India still cast their sombre shadows over his mind.

He relies on memory to the exclusion of imagination. All his works are imitations of Nature, faithful, it must be said, but still imitation. In the garden Nature must be idealised.

That is where Marcel De Smet surpasses Gavin Jones in particular, and all his contemporaries in general. The son of an artist of no mean repute, for artistic imagination his work is unrivalled. "S. I. B.'s" charge of "artistic and technical faults" may be dismissed as the frivolous vapourings of an anonymous carper.

Captain Symons Jeune has the virtues of Gavin Jones without the vices. There is poetry and imagination in his work. But he is erratic and unreliable, disappointing at times, even to his ardent admirers.

As for John Wood, if, instead of dividing his energies between kicking the R.H.S. and patting deserving artists on the back, he would show us again what he can do on the rock bank, he would give pleasure to all and render yeoman service to the cause of art in the rock garden.

C. PENROSE.

Taplow.

An alleged Sprekelia cross

DURING this spring I crossed a Hippeastrum with a Sprekelia, the former being the seed parent. The pod has just ripened and burst open, revealing a great many more seeds than I can use. I am reluctant to waste any of them, and should be very pleased to give some of them to anyone interested and patient enough to grow them. The seedlings take, I believe, from three to four years to flower. Next year I hope to make Sprekelia the seed parent.

(MRS.) EMILY M. BURN.

34, *Old Road, Llanelly, Carm.*

Meconopsis Baileyi

In view of the correspondence on this subject, I am surprised to see that Mr. F. C. Puddle commits himself to the sweeping assertion that this plant is "perfectly hardy in any part of the British Isles"! It is not hardy here, and is not so anywhere within reach, and as he is writing from Wales, may I ask what authority other than hearsay he may have for saying it is? As emphatically as I can I contradict his wild statement. Further, I defy him to find a decent group of it in any garden in N.W. or N. Yorkshire in the Pennine Chain! I will accept his statement for North Wales, but I am not the only one who will refuse to do so for this part of the country.

J. R. K.

Yorkshire.

Arenaria Ledebouriana

A long-time grower of Alpine flowers, and well informed regarding the various species of rock plants, in looking over my garden the other day espied a specimen of Arenaria Ledebouriana, and expressed what was in my own mind, that it was "a much over-rated plant, and hardly worthy of the p stowed upon it by Farrer," who sa a most charming little gem." O Arenarias known to me I consider most worth growing are A. montan balearica, which both seem indisper

A. Ledebouriana reminds me too that inappropriately named A. grar a name which should rather have plied to A. montana. But it forms rosettes of a rather grey tone, whi slender stems with small white flowe not a plant which one would consi pensable, but once in the garden it main, and will give some pleasure soil in a sunny place.

S. A

Gillenia trifoliata

A plant whose beauty is certain estimated in gardens is the above, found in full bloom in Mr. Millard at Felbridge, Sussex, a few days single plant being literally cove charming, elegant sprays of white averaging 3 feet in height, and the pl about the same width. This we and distinctly graceful plant, with it stems, loose, branching panicles o and pleasing effect, should not on count be neglected.

E. MA

Solanum jasminoides and Eccrem scaber

These two delightful old climbers so frequently seen in our English g they deserve to be. Although the is a native of South America, S. jas seems to be quite hardy in Kent, and Sussex, and in the still milder c the West of England. During the ter the plant we have on the fron house was subjected to icy wind snow, and successive frosts, which o occasions were as much as 22 deg therefore, pleasing to be able to re it is now in blossom. The sno delicate trusses of starry flowers, s its own dark green, glossy foliage, a charming thing to lightly clothe t of the house or garden shelter.

Eccremocarpus was not so fortuna but in Hertfordshire it grew for ma under the overhanging thatch of a house, where the roots were sufficie tected against frost.

Nymphæa stellata, the beautiful blue Water Lily

Primula scotica

Longevity of Tulips

A year or so ago in my notes relative to Tulip culture I mentioned the existence of Tulips in a cottage garden which continued to flower, although, to my knowledge, they had not been disturbed or attended to for over 40 years.

I think it will interest some of your readers to know that during the past few days the opportunity has been afforded me to lift these, and the results are interesting. The border in which these were growing lies between a cobbled path and the cottage wall. The natural soil consists of strong, heavy loam. Over the surface of the soil were hanging arms of Virginia Creeper, which probably accounts for the fact that the border has never been cultivated. The present owner has been in the occupation of the house for upwards of 50 years, and it was his father's before him for a period of years nearly as long. Having some remembrance of his father, I should doubt if he planted these Tulips, so that the age of the clump can be certainly placed at over 50 years, and quite possibly double this length of time.

Careful removal revealed a tightly packed nest of bulbs extending from within an inch of the surface of the soil, and approximately 1 foot thick. Actually I lifted something over 200 bulbs, which were felted together in a peat-like mass of decayed roots and scales; the cluster was about the size of a large wasps' nest. The remarkable fact was that while there were so many bulbs, only perhaps a dozen of the number were of flowering size, and these were not dwarfed, but appeared to be quite normal and natural in every way. The average size of the remainder of the bulbs was about the thickness of a lead pencil. Every bulb was perfectly healthy.

I think the chief interest of this occasion is to illustrate that under normal and natural conditions, without any feeding or watering or culture of any kind, cottage Tulips have a constitution capable of withstanding the rigours of our climate for an unlimited number of years, and that (as with the Narcissus family) it is only when we embark on high cultivation and constant lifting that the constitutions of the subjects become impaired and liable to the ravages of disease.

As a matter of fact, the flower produced by this particular Tulip conforms to no modern variety, but is very similar to the old Semper Augustus illustrated in Sir Daniel Hall's book. I cannot, of course, claim that it is identical, as, unfortunately, the flower had faded before the book was published during the present year, but I hope to make a closer comparison next year.

HERBERT G. LONGFORD.

Abingdon.

Wild blue Lupins

THESE beautiful wild flowers are now blooming on gravelly heaths in several localities in Orkney. They apparently thrive best on poor ground, but have the property of extracting nitrogen from the atmosphere, which is fixed and goes to enrich the soil.

THOS. KENT.

Kirkwall, Orkney.

Lupins in Orkney

In the Orobian Alps

I have returned from a marvellous journey in the Orobian Alps above the Lago di Como. The Fire Lilies (Lilium croceum) were all about the country, flaming the ground, rocks, field, underwoods. Daphne striata, the Potentilla nitida, and the Gentians were at their glory. Now I must stay here for some weeks quiet and working.

Geneva. H. CORREVON.

Ostrowskia magnifica

I HAVE read with interest the note by Mr. Marshall, issue July 6th, page 471, on the failure of his Ostrowskias. Here we have the same thing; our best plants, even those which generally reached 2 metres high, are this year very weak and poor. It cannot be the frost as in this case the plant would not have grown at all. It seems not to be the drought of last summer as the plant likes the hardest drought for its rest time. We do not see any fungus. What can it be? This is a mystery to me. H. CORREVON.

Geneva.

Garden weeds

By LT.-COL. WOLLEY-DOD

AN article appeared in "The Times" of June 8th, headed "Beautiful Garden Weeds," which leads me to think that a few remarks on weeds generally may be acceptable, at least to beginners in gardening.

To define a weed is always difficult. It is sometimes defined as "any plant growing out of its proper place," which is a fairly good definition, but not quite what the gardener means by a "weed." It may be defined for gardening purposes as "any plant which tends to spread itself inordinately or to establish itself ineradically," a long definition which I am unable to condense, unless by omitting the second portion of the sentence. "Any undesirable plant" is not a good definition, since it leaves too much to individual opinion, and some of the prettiest garden flowers are weeds to a gardener.

Weeds, by my definition, may be classified as follows:—

A. Plants which seed themselves profusely;

B. Those which spread inconveniently either above or underground;

C. Plants whose roots or tubers remain in the ground, usually at a considerable depth, and persistently send up their stems after the main plant has been removed.

Class A contains not only many of the worthless adventitious weeds of cultivation, but also a considerable number of otherwise very desirable garden plants. Their demerit varies in different soils and situations, and, to a great extent, on individual taste. They may be annuals or perennials, but their destruction is not, as a rule, a difficult matter. Hoeing and raking, with as much hand-weeding as there is time for, should keep these in check, though some are very prolific and persistent. In my own garden I think the three worst are the Hairy Bitter Cress, Thale Cress, and Perennial Pearlwort. These three have so short a period of life and are often so small and hidden among other plants that they germinate and ripen their seeds before they are detected, and run through two or three generations in a season so as to increase in geometrical progression if not kept in check. Hoeing in wet weather is almost useless (this is especially true of Annual Meadow Grass), and in any case impossible when the weeds are mixed up in some small tufted alpine or in the crevices of a rockery. Persistent and untiring hand weeding is the only real remedy. A golden rule is never to let them ripen their seed, a maxim which is most difficult to impress upon the ordinary jobbing gardener, who hesitates to "put the 'oe through" until there is something substantial to work upon, after, of course, all the seed is shed, or when it is quite ready to ripen on the hoed up plants.

Ostrowskia magnifica, the great Oriental Bellflower

Of garden flowers which require much attention to prevent their taking charge, I would mention Foxgloves, Campions, some Erysimums, Iceland and other Poppies, especially the yellow Welsh, some Campanulas, especially lactiflora, Linaria purpurea and reticulata, Eschscholtzias, Bishop's or Gout Weed, Cape Gooseberry, and many others. They are, as a rule, easily disposed of, though some, for example, the Welsh Poppy and Campanula lactiflora, make small, nearly invisible, seedlings the first year, but insidiously produce a thick rootstock, rendering their abolition in the second year a matter of much greater difficulty.

Class B might perhaps claim not to be considered as weeds in the usual sense, but rather as aggressive subjects presenting some of the undesirable qualities of weeds, such as swamping out less pushing, though equally desirable, subjects. Such are Cerastium tomentosum, Mossy Saxifrages, Perennial Sunflower, and many others, in which one might include Aubrietias and Pinks. All these are quite easily kept in check by clipping or digging round so as to remove the superfluous growth, but I admit that I have not found a satisfactory way of keeping Mossy Saxifrages in check.

Class C is by far the worst class the gardener has to contend with, though, like other classes, it contains some very beautiful flowering subjects. Provided that a very careful judgment be exercised in selecting suitable positions when first planting this class of "weeds," where they can be left indefinitely, they are for the most part harmless, but woe betide the novice who allows such a plant as Polygonum c tum to take charge and then hopes to or remove it. It is said that persistent will kill any weed, but I have with hoed or dug off every shoot of this soon as it has appeared above ground letting it get up to 6 inches high, a rarely more than 1 inch. I should a I began by digging it out to a depth 2 feet. It still continues to appea seven years, though it is certainly we In a waste part, where I kept variou of rubbish, I have completely abolishe the use of weed killer, but this cannot in flower beds. An equally persisten is Lathyrus latifolius, and I think folius is as bad. There are other which run these pretty close, but of fortunately for me, I have little perso perience, but I have seen enough of Tail (Equisetum spp.) and Sheep's (Rumex Acetosa) to wish for no acquaintance. Such deep-rooted per as the Oriental Poppies, Globe Thistl Campanulas, especially Rampion, P Lily, and even herbaceous Phloxes established, are most difficult to er completely, and will go on sending u shoots for some years, but persistent out sooner or later will abolish them. never found Couch Grass nor C Thistle so difficult of abolition as is su The ground on which I made this was overrun with both when I took I practically entirely abolished both in year on a space I afterwards sowe grass, and in two years no more wa seen in the flower garden. It is si question of forking it out as soon as it, and I never formed the intense hat either that I have for the procumbent wort or the Hairy Bitter Cress.

I will conclude by a word or two on in paths or on lawns. The former ar easily dealt with by a weed killer, and fer a poisonous one, though one m careful in watering it on not to spla leaves of the flowering plants or th inevitably be killed. The roots of the ing plants are not injured provided the does not go into their crowns, or so surrounding soil so much as to reac roots. I have even been quite succes poisoning Pearlwort in a Daffodil be out any harm to the bulbs. For w grass I find lawn sand, applied in spri autumn if they are bad, or once a yea numerous, is a complete remedy. The are surprising. The difference betwe lawn when I came and now must be be appreciated. Large unsightly pat Pearlwort, Mouse-ear Chickweed, etc appear as if by magic, though someti the expense of a bare patch for a few The coarse grasses and such weeds a bous Crowsfoot, Sorrel Dock, and one others, are slower in responding to th but disappear in time. Dandelion Daisies in small numbers are easily out and instead of millions are now tically absent from my grass.

The golden rule is persistent and ea tention, almost entailing drudgery a and never allowing any weed to shed it It is by the application of such princip my garden has earned the appellatio "depressing" one, the "depression" on the part of those who, by giving less tion to their weeds, possess a wild instead of a garden.

Sow more Spinach

Where there is a demand for this some vegetable small sowings at fre intervals will maintain fresh supplie rather moist and shady place will giv results during dry, hot weather.

wers in the London Parks and Gardens

E flowers in Hyde Park, Kensington rdens, Kew, Hampton Court, and chmond have been very beautiful dur- e past month or so. Double Wall- s, Intermediate Stocks, Violas and s, Caltha palustris flore pleno, uble Marsh Marigold, associated with Forget-me-not, and Tulips in great have been quickly followed by Lupins, of Nice Stocks, Hydrangeas, Calceo- and the Rhododendrons. The Tulips ampton Court were at their best at un, and the following were varieties of nding merit: La Candeur (white), a ed, carpeted with purple Aubrietia, , but most effective; Clara Butt (pink) with white Arabis and blue Forget- t as a groundwork, very charming; William Pitt and T. Massachusetts, -scarlet, carpeted with double white s; Tulip Greuze, a striking purple; , a distinct shaded pink, associated Nigella Miss Jekyll; Tulip Isis, a fine red; Fensée Amère, an unusual colour, slate; Tulip Nauticus, cerise; Bronze , bronze; Giefs, another good purple; Copland, mauve; Sultan, almost black, ne of the most distinct to my mind; Queen, pink, with a bronzy-yellow very beautiful among specimen plants izanthus Grahami carmineus. Among Tulips that were out, Gesneriana still held its own. Another pretty effect bed of Tulips Murillo and Clara Butt, a groundwork of Aubrietia; Maurine, mauve; Tulips Princess Elizabeth and e, pinks; Aspasia, buff; Madras, a tall -scarlet, following Cramoise Brilliant, fine. Tontinette, maroon; The Fawn, colour as the name; and La Tristesse, -mauve, made a truly magnificent The Azaleas were just coming out, ere were wonderful beds of Cinerarias, ed with Primula malacoides and and white Pansies, Double Cherries, en "Chestnut Avenue" in perfection, gh there was not a single Horse nut then in blossom in our district).

Kensington Gardens some uncommon nteresting plants bloomed in the bed ed for them in Church Walk. They e Leptospermum Boscaweni, an attrac- le pink flowering shrub from New Zea- Glaucium flavum tricolor, an choltzia-like flower of tangerine colour Asia Minor; Primula Littoniana, bear- ttle tapering spikes of mauve flowers he top half bright red (China); Felicia is, a mauve Daisy from South Africa; nthemum formosum, yellow with a ate blotch (Portugal); the whole d by some truly wonderfully grown of Sutton's double red and pink Gode- In Hyde Park late in June there were interesting things to be seen, including ium fastuosum, an orange Daisy with k central zone, from South Africa; a anethoides, another orange Daisy South Africa, with attractive Fern-like and an excellent erect habit. Other id beds consisted of Iris Imperator, Hydrangeas, creams, pinks, blues, and , looking very happy under the trees; laria Hybrids, grand; and Stock y of Nice variety Summer Night, a ep purple. At Richmond a fine drift t lovely blue Phacelia Campanularia, very well in the new rock garden the terrace, and the Gloxinias and her- s Calceolarias in the conservatory, ged with Maidenhair and other Ferns, ell worth a journey to see. There is d for the Londoner to go to the country to see flowers to-day; indeed, we go from the country to London to see new varieties and get ideas for our bedding schemes. Last, but by no means least, one must mention Meconopsis Baileyi in Kensington Gardens.

A. L. W.

Rheum undulatum

WHERE there is space for a large group of important flower and foliage, or even for a single plant, this fine Rhubarb is in place. The large radical leaves are a foot long and as much wide, and are, as indicated by the specific name, boldly waved at the edge. The flower-stalk rises up clear and tall, with its close clusters of creamy bloom, to any height up to 6 feet. If it can be where there is dark foliage at the back, such as the Yew hedge of the picture, it is seen to the best advantage. It is nearly related to the Rhubarb of our kitchen gardens.

G. J.

Rheum undulatum

Notes from North-West Cheshire

I WAS very pleased to see that "H. G.," in his "Notes from the West," in the issue of June 22nd, refers to the highly coloured Wallflower, Cheiranthus Allionii. Of all long-flowering and easily raised plants, the Siberian Wallflower, probably the most highly coloured of garden plants, is without a rival. In this district, by sowing the seed in early and later sowings the Siberian Wallflower is in bloom practically the year round. Even throughout the long, severe winter of 1928-29, certainly the most severe in our records of more than 40 years, there were very few periods in which our gardens were not relieved from their sombre and frigid appearance by vivid splashes of this brilliant and easily raised Wallflower.

Our first sowing this year was on June 12th; the first signs of the tiny seed-leaves appeared above ground on the 19th. On taking a test from the same sample of seed sown, I find that the germination is very low; about 75 per cent. And one wonders if the seed supplied is fresh.

The seed-bed should be composed of light, sandy soil, and deeply dug, with time to settle before sowing. It is important that the soil should be fairly firm—we tramp over the bed with the feet—for the object should be to secure strong, stocky plants. This applies also to the bed in which the seedlings are transferred.

The Siberian Wallflower is a much hardier plant than the ordinary improved kinds. Last year there were thousands of Wallflowers destroyed in a single night, their blackened and tattered remains were consumed on the smother heap! But there are many interesting incidents of profit and loss in the plant-raising of the past winter that cause one to think that with protection very many deaths might have been prevented.

Wallflowers planted in a long border, with a low wall running down the centre, gave one the impression that it only requires a little shelter to assist the plants to come safely through the severest winter. On the side facing the north-east—we had long spells of cold, blighting east winds—every plant perished, while on the side facing south-west a large percentage of the Wallflowers came safely through and bloomed with most satisfactory results.

On a raised border, with probably a thousand of the common, though beautiful, species, Iris germanica, with a few clumps of an old creamy-white kind that I do not know the name of, came into good leafage, blooming three weeks later than usual, but quite 60 per cent. of the plants were blind. It is interesting to note that every plant of the creamy-white variety bloomed to perfection.

I think we may safely assume that the frost damaged the embryo buds of the Irises, causing so many casualties. Even here, again, I am of opinion that a little protection would have brought many of these Iris germanica safely through.

We have always considered our various species and hybrids of Montbretias quite hardy in our light soil. Indeed, we have never had occasion to give them any protection other than their own leafage. This applies to the newer kinds also, but this season has nearly killed all the Davison and Earlham hybrids. From a few plants of Citronella, George Davison, Lord Nelson, Prometheus, Star of the East, and Queen of Spain we had in the course of a few years several hundred plants. Still, there is something in our failures that spurs one on to further aims and ambitions, and we shall make the best of those that are still left to us.

SALIX.

Sowing Primula malacoides

A final sowing of this dainty little Primula should be made at once. While dryness is much against success with this subject, damp is worse, few other plants being so easily over-watered. Every care must therefore be taken at all stages of growth with the watering, while, like most Primulas, shade from bright sunshine is imperative.

Cutting down Delphiniums

Unless required for seed, the old flower spikes should be removed down to the leaves; this will not only conserve the strength of the plants, but assist in retaining the freshness of their foliage over a much longer period. Vigorous plants cut down to within 6 inches of the ground at this date will flower a second time.

Looking Backward

Pests and diseases that follow one another—and how some have been checked

By Thackeray Turner

I STARTED making this garden in 1899 and, looking back over that period, one thing which seems to me most noticeable is the succession of pests and diseases which have followed one another. When one pest has been overcome another arises. The first, I remember, was all our Roses becoming hopelessly mildewed. We overcame this by working the ground over and raking it quite smooth, and then, before any leaves were showing, buying Dorking lime and slacking it until it was like flower, and then putting a covering of it all over the ground so that it looked like a fall of snow. It was left until the bushes were in full leaf and then forked in. We have never been troubled with mildew since.

The next trouble came in the kitchen garden. All the Gooseberry bushes were covered with green caterpillars. We picked them off by hand, but that was of no use, and the bushes were left bare of leaves. This went on for more than one season, and then, when watching my gardener, I saw there were more caterpillars fallen from the bush than in his bowl, so I told him to stop picking and to make a ring of soot close round each bush, and every day to go round with a forked stick and give each tree a shake. Very soon the bushes were all free of caterpillars, and as they all died before they could turn into chrysalises it stopped their breeding. We have not been troubled with them since.

All our Nut trees have been infested with maggots in the Nuts for about six years. This I do not know how to overcome. Our Black Currant trees were very bad at one time with Big Bud, but we are nearly free from it now, and I think this is greatly due to our picking off the big buds and burning them. The next trouble came in the flower garden. All the Hollyhocks became badly diseased, and it became worse year by year till we gave up growing them. We bought some seed, but the seedlings were covered with the disease, which looks as if it was in the constitution of the plant. We now have a rule that no plant shall be kept for more than two years, or three at the most, and we are fairly free of the disease. My idea is that if the roots run deep, as the old ones do, they get down into the sand, where they can have moisture but no food, and so do not grow strongly and healthily. It is very noticeable that healthy plants, like healthy animals, are generally free from disease.

Rose trouble came next. They were badly damaged by Green Fly, but as I have already told your readers, this was, and has been, and can continue to be, overcome by watering the roots with guano-water. It is quite delightful doing this, for the joy of seeing in a day or so all their little dead bodies on the branches.

The Madonna Lily has ever been
culty, and many experiments have b
here to avoid or overcome the diseas
kills them. I think the best cure i
them up in August, if diseased, and
lie on the open ground until they tur

emerocallis for woodlands

Day Lilies, members of the genus ocallis, are easily grown and desirable either for grouping in the herbaceous or for massing in the wild garden or and. Grown in open glades of the and garden with some of our native as a groundwork, their tall, handsome of flowers are remarkably attractive. are moisture-loving plants and thrive a well-worked retentive soil, and if desired to grow them in light, sandy their water-holding power should be sed by liberal additions of organic e when preparing the sites for plant- The individual flower is evanescent, der good conditions of cultivation the spikes bear a large number of flowers follow each other in rapid succession, a display of flowers is maintained long period. The dominant colour of wer is yellow, which varies in shade the clear canary-yellow of the old and nown species H. flava to the bronzy-e, almost flushed crimson, of some of odern hybrids, and their flowering begins in May with H. flava and is through to September by the late-ing but beautiful Japanese species H. tiaca major.

Middendorfiana, an Asiatic species, is a plant, its soft orange-yellow flowers particularly attractive and its foliage singularly graceful. H. flava is probably the most popular member of the genus. It produces its clear yellow, sweetly perfumed flowers on stout stalks from May till July in great abundance, and should be grown in every garden; its variety major is somewhat taller growing and equally useful. H. fulva is a rather stronger growing plant, with deep golden, almost coppery-red flowers, but it has not the graceful habit of H. flava.

H. luteola is a very vigorous species of graceful habit, its beautiful golden flowers are freely produced on branching stems which frequently reach a height of 4 feet.

Many of the new hybrids are very handsome plants and add considerably to the decorative value of the genus. Notable amongst these are Orangeman, with large heads of clear, bright orange flowers borne on slender stems; Dr. Regal, with distinct, large flowers of a rich apricot colour which succeed each other from May till August; Gold Dust, with deep orange flowers; and Sovereign, with soft yellow flowers which colour a rich brown on the outside of the petals. W. AUTON.

Well-constructed garden seat and shelter surrounded by herbaceous flowers

Rose leaf diseases

Every rosarian knows the parasitic fungus Black Spot appearing on the foliage of his Roses as purple blotches which rapidly darken and become black. Leaf Scorch has a different appearance, the pale yellow spots gradually darken with a purple margin. Blotch is a brown infestation attacking the soft new shoots and buds. In the way of eradication not much can be done. Spraying with liver of sulphur, 1 oz. to 3 gallons of water, or with a fungicide like Bordeaux mixture, should be practised to prevent the diseases from spreading and to keep them in hand. Mildew is a disease much more destructive and crippling than is generally supposed. It may be cleared away by any good fungicide. Then there is rust, but this is seldom harmful to any extent to garden Roses. In all cases it is very necessary to rake up and burn the fallen foliage in the autumn and give the soil a dressing of slag and potash salts in equal parts. In winter and spring spray the bushes with formalin where Scorch, Spot, and Blotch are known to be. F. H.

Flowers on the window-sill

A box to fit a sill does not cost much, and can be put together easily if the material is handy. The idea of having flowers on your sill this summer may not have occurred to you, but there is plenty of time to proceed. The box should be provided with broken pieces of pot for drainage, and filled with loam and leaf-mould and sand well mixed. A sheet of zinc fastened on the sill on which the box can be placed will prevent damage to the stonework or bricks by moisture. Fuchsias, Heliotropes, Verbenas, Snapdragons, trailing Campanulas, Nasturtiums offer a selection, and, if young plants are put in, will soon get established and bloom if the position be a sunny one. Another way is to put plants in pots in the box, which gives one the opportunity of changing the occupants occasionally if desired. LEAHURST.

Summer treatment of Perpetual Carnations

OUTSIDE in the border Perpetual Carnations are opening a month earlier than the old type of Border varieties, and it is satisfactory to be able to secure flowers even before other herbaceous plants are at their best.

Perpetual Carnations are not only more easily cultivated outside than under glass, but they appear to have more fragrance, which is by no means a slight charm.

Those young plants being grown on for winter blooms should be in their flowering pots now, and by using a coarse (chopped, not sifted) compost of turfy loam three parts, and well-rotted manure, brick or mortar rubble and coarse sand, half part each, they may be firmly potted if the pots are well provided with drainage of a double layer of crocks. A 6-inch pot full of coarse bone-meal to the small barrow load of compost adds body to it, stimulates root action, and feeds the plants, and if the loam used is known to be poor, the same quantity of Carnation fertiliser and likewise of soot is helpful.

Carnations always seem to stand still after potting, and the anxious grower becomes impatient, yet this phenomena is normal and need not cause one to worry. From a 3-inch pot to one of 6 inches in diameter is a considerable step, and some care must be taken not to over-water such newly potted plants until the roots are around the pots, after which they may be watered freely.

It is a good plan to stake at once these freshly potted plants in order that the new shoots may be secured as soon as necessary. Freshly potted plants do better if stood on a bed of new ashes than on a dry or, as it sometimes is, a hot bench.

One over from China was telling me recently that while his gardeners are good on the whole, he has the greatest difficulty to prevent his men putting the young Carnation plants at the bottom of the pot and filling the pot up with soil, as one would grow a Tomato. I asked him if he did not lose many from stem rot—the plant dying off at the root—to which he replied "Many." Deep potting is, of course, the most fruitful source of stem rot.

There is much satisfaction in watching the deliberate, if slow, progress, of the newly potted Carnation. It grows in the reverse way to a vigorous annual which springs up from seed, and there is no spontaneous growth, but first the promise, then the development, and finally the growth which we know is the forerunner of our winter blooms. It is the summer cultivation of the Carnation which matters more than anything else, and the born cultivator evolves his best methods according to the means at his disposal.

It is not always the orthodox methods which produce the best results, and although it is dangerous to give unorthodox advice, I must say that if I were an amateur with only a limited time at my disposal, I should prefer to plunge my pots in soil rather than stand them on a dry bench in hot weather. The risk of too much wet on one's plants outside is better than a hot, dry atmosphere in summer under glass. The ideal is a frame in which the plants may be plunged in ashes or soil, with glass lights which can be used to cover the plants in excessive we
but in hot weather the plants sh

in South-Western Scotland

a considerable number of the Roses in gardens suffered to a very appreci- tent from the abnormally severe and g frosts of February is absolutely cer- it it must also be said that they re- reatly during the following months; when they usually begin their evolu- aving been especially favourable. In d early July, with genial showers and t alternating, and thus creating ideal conditions, they flowered, for the art, with great facility and artistic eness, and their blooms were of excep- lustre and size. This affirmation is lly expressive of such notable repre- ves of the Hybrid Teas as Princess th of Greece and Mme. Tresham raised at Waltham Cross (which are stinctive and of rare decorative cap- , Caledonia and Margaret Anne Bax- iny-white), the former of which origi- at Messrs. Dobbies' nurseries on the s of Edinburgh, while for the latter, a ledal Rose, we are indebted to Messrs. s Smith and Sons, Stranraer. Both of re very beautiful, in all probability two finest in cultivation. Among dark, -crimson or maroon introductions, few ore distinctive or commanding in than Etoile de Hollande and Colonel Fitzgerald, which are at present s in this garden; while Hugh and Dickson and the much more Earl Haig are also quite admirable, Irish Roses (whose fragrance is most ting) affording a fine artistic contrast, e influence created by light and shade. varieties of contrasted hues that have ery conspicuous during the last two s are Golden Emblem, Claudius Pernet t Ducher), Mrs. Wemyss Quin, a of Newtownards, and Mme. Edouard t, coral-red and exceedingly luminous, which my own French namesake is l; while some of the more venerable es, such as the artistic and refined a, Mme. Alfred Carriere, and the incomparable Margaret Dickson, have han maintained their great reputation.

David L. Williamson.

R.H.S. Amateurs' Show

new hall of the Royal Horticultural was satisfactorily filled with exhibits sday, July 9th, on the occasion of the urs' Flower Show. The competitions livided up into three divisions. The as open to all amateurs, the second to mateurs who do not regularly employ paid assistants in their gardens than rdener and one boy or part-time man, e third to bona-fide amateurs who regularly employ any paid assistant garden. A great variety of subjects petition was provided in each division. was a host of classes for cut flowers. hedule was most comprehensive.

t Peas were superbly shown. In the r 12 vases there were seven competi- grand series of varieties winning honours for Mrs. A. Wigan, Dan- ark, Chelmsford. The varieties were in, Sunkist, Gleneagles, Youth, Monarch, Grenadier, Magnet, go, Ivory Picotee, Avalanche, Mrs. A. , and Powerscroft. In the class for s of Violas Mr. A. D. Bates, Stony rd, had a good series in which the ng kinds were shown. Drummer , Agnes Bryce, Helen W. Cockrane, ohnstone, Kathleen Condry, Mrs. Jas. ; Mrs. H. Milner, Mrs. Florrie , Kitchener, Moseley, Ideal, Rowan, and Admiral Jellicoe. The four com- s in the class for six vases of cut sprays of hardy shrubs in flower made a beautiful display. The first prize was won by Mrs. A. Desborough, Tulgey Wood, Broadstone. This exhibitor set up some quite uncommon subjects, such as Desfontania spinosa, Zenobia speciosa, Cornus Kousa, Embothrium coccineum, Styrax japonica, and Abutilon vitifolium. In the larger class for 12 vases of cut sprays of hardy shrubs in flower there were as many as five competitors, and they made a most noteworthy display. Mr. Lionel de Rothschild, Exbury, Southampton, secured leading honours, showing superbly Helichrysum rosmarinifolia, Leptospermum Chapmanii, Zenobia speciosa, Azalea optima, Escallonia langleyensis, Magnolia macrophylla, Buddleia alternifolia, Ceanothus De Fosse, Genista virgata, Spiræa discolor, Cornus Kousa, and Rhododendron discolor. There was a splendid array of Delphiniums in the leading class for 12 vases, three spikes in each vase, not fewer than six varieties, which was contested by three entrants. The first prize was won by Mrs. Hamilton, Kingsmead, Claygate. This exhibitor showed several very good seedlings and good spikes of Blue Bird, Edward Bromet, and Robt. Cox. Carnations also were well shown, M. Lionel de Rothschild winning first prize in the class for nine vases of perpetual-flowering Carnations, eight blooms in each vase, nine varieties. Superb examples of the following kinds were beautifully displayed: Topsy, Czarina, Sir P. Sassoon, Bis Greenfield, Laddie, Surprise, Marion Wilson, and Brilliant.

The four entrants for a group of flowering and/or foliage plants, arranged on an area of 100 square feet, made a noteworthy display. They were all good. First prize was again won by Mr. Lionel de Rothschild, who had many grand Anthuriums, Hydrangeas, Carnations, Crinums, Clivias, Ferns, and other foliage plants, all tastefully disposed. In the class for 12 vases of hardy flowers, 12 kinds, there were no fewer than seven exhibitors. Premier honours were won by Lord Woolavington, Lavington Park, Petworth. Included in his exhibit were good examples of Erigeron Antwerpia, Lilium

Aureate, the new Gold Medal Rose

Shown by Alex. Dickson and Sons at the Summer Show of the National Rose Society. Colour deep yellow umbelatum splendidum, Delphinium seedlings, Galega officinalis compacta, Lychnis chalcedonica, Verbascum vernale, Pæonia alba plena, Campanula celtidifsia, and other good things. An interesting exhibit was provided in the class for six vases of flowers raised from seed during the 12 months preceding the show, not fewer than three kinds. In this competition the first prize winner was Mr. H. E. Dunhill, Mount Lodge, Harpenden. He showed annual Chrysanthemums, Candytuft, Gypsophila elegans, Antirrhinum Yellow King, Eschscholtzias, etc., all in splendid form. There were as many as eight competitors. D. B. C.

Interesting plants at the Royal Show, Harrogate

The largest combined show of agriculture and horticulture in the British Isles closed on July 12th. The horticultural show is one of the best out of London.

In a gorgeous combination of Begonias and Delphiniums, Blackmore and Langdon had that beautiful type of basket Begonias with racemes of flowers some 2 feet to 3 feet below the basket. This type is most effective in the conservatory.

A run of herbaceous plants 300 feet long included the fine Delphiniums Jenny Jones, which has very dark outer petals with Oxford blue centre, and Nora Ferguson, a Cambridge blue. Knight of Somerset is another distinct variety with compact, long-lasting spikes of navy blue. Outstanding groups of these came from Bees, Chester; Kelway, Langport; Hewitt, Solihull; Bakers, Codsall.

The blue Erigerons are always good at this season and last well. Fine examples were shown in the extensive groups of Messrs. Gibson, Bedale; Harkness, Bedale; and Maurice Prichard, Christchurch.

For large herbaceous borders the Eremurus Bungei, with its noble yellow spikes, is very effective. Messrs. Artindale, Sheffield, and Bakers, Codsall, were strong with these, the same firms showing the effective Thalictrum glaucum and Verbascum vernale. Messrs. Toogood specialised in Gladioli.

The amateur does not always obtain Sweet Peas of such quality as seen here. In Messrs. Sutton and Sons' group, which filled the whole end of one tent, Gold Crest, an orange-scarlet, was very prominent. Royal Blue, in Messrs. Bolton's fine group, is a colour loved by all. So, too, is Mammoth, an orange, seen in Messrs. Alex. Dickson's display from Newtownards, Ireland.

One whole side of the great tent was filled with Roses, making a glorious sight. Bedford Crimson, shown by Laxton Bros., is of that solid, fragrant type of Rose beloved by rosarians. Lady Mary Elizabeth is a glorified type of Lady Inchiquin with deeper cerise and finer petals. Shown by the raisers, Messrs. Alex. Dickson and Sons.

Desmond Johnstone is a most distinct Rose of port wine crimson with a base of yellow flushed through the flower; Golden Gleam, a most refreshing yellow; Mrs. A. R. Barraclough, a rose-pink with a ray of gold through the petals, which are of exhibition form. Rose Marie is not truly an exhibition variety, but it was described by one exhibitor as the best of all pink Roses for the garden, with its shapely long flowers that remain on the bush good for a week. These and many others were shown by Messrs. W. Lowe and Sons, Beeston; Thos. Robinson, Nottingham; Frank Cant, Colchester; Wheatcroft Bros.; and Wood and Ingram. Quite exceptionally fine was a basket of B. R. Cant's yellow variety, Mrs. Beatty, with its Maréchal Niel-like perfume. Ivy May, a well-coloured, dainty flower, of Mme. Butterfly type, came from Messrs. Jarman, Chard.

The Border Carnations, salmon and scarlet Cloves, from Mr. Horace Lakeman, Thornton Heath, are of the best type, with fragrance.

Messrs. Allwood Bros. had a pretty form of Dianthus Allwoodii in Esther, a dainty mauve with rich purple eye. A collection of these Dianthi flanked a noble group of Perpetuals.

Carnation Evelyn in Mr. C. Engelmann's exhibit is an uncommon shade of rose flush with pale rose-pink. Kathleen is a clear shade of salmon without any red, and of exquisite form. Countess of Harewood, a perfectly rosette type of Perpetual, of bright rose-pink, were included in Stuart Low and Co.'s group.

Those who have well-heated greenhouses may indulge in many plants not enjoyed by others. A feast to the eye was the group from Messrs. Cypher, Cheltenham. Stately Crotons vied with such brightly coloured foliage plants as Reedia glaucescens, with its white leaves, and the long-lasting spathes of Anthuriums, and scarlet Clerodendron fallax, while the graceful Humea elegans gave a light effect. In this group the more homely but equally lovely Fuchsia was not despised.

FRUIT.—The King's Acre Nurseries demonstrated what an interesting and profitable hobby the growing of fruit trees, etc., in pots may be. Pears with many fruits nearly mature on each tree included Doyenne Bossouch, Beurré Giffard, and Margaret Marrilat. With Apples, the better colour which one secures with pot-grown trees makes them look more tempting. Jas.
Grieve is, of course, delicious, but W
Pearmain and Lady Sudeley are
look at. Plums nearly ripe of River
Prolific, and Czar, Figs, Gooseberr
Currants, also nicely finished Gra
Downe's Seedling all made a fine c
of fruit trees.

From Gardening Illustrated

Fifty Years Ago

In reserve

THE General who sends all his forces into action at once stands a great chance of defeat and of being without the means of covering his retreat. So, also, the flower gardener who only grows sufficient plants for his beds, or that gets rid of his surplus stock when his beds are planted, runs a risk of having unsightly blanks. This season has been especially fertile in perils to young plants. The weather, to begin with, has been very ungenial, and this has been accompanied, as such seasons usually are, by other evils in various forms. There are perils from insects and creeping things; birds, too, are often troublesome. I find sparrows are especially fond of the variegated Mesembryanthemums, and starlings display a propensity for nipping off the tops of Coleuses. Then there are the Red Ants which congregate round the roots of the Pelargoniums and eat away the bark round the collar of the plants until they turn sickly and die. It will thus be seen that with so many possible difficulties, and others, such as the hoe of a careless workman, to contend with, it is never safe to cast away surplus plants till every bed is well filled up. . . . The same principle should run through the kitchen garden, for it is quite as necessary to have in reserve young plants of all those things commonly raised at home as it is with flowering plants. . . .—July 19th, 1879.

orfolk and Norwich Horticultural ociety's Centenary Show, 1929

July 11th a deputation from the Royal ultural Society, consisting of Messrs. Bowles, W. Cuthbertson, T. Hay, and Leak, with the Assistant Secretary in ance, visited the Norfolk and Norwich Horticultural Society's Centenary Show at Norwich and made the following awards:—

GOLD MEDALS.—A. J. and C. Allen, Norwich, for Roses; Dobbie and Co., Edinburgh, for Sweet Peas.

SILVER-GILT FLORA MEDALS.—R. H. Bath, Ltd., Wisbech, for Delphiniums and other herbaceous plants; Daniels Brothers, Norwich, for a mixed group of Gladioli, Roses, Sweet Peas, etc.; A. Reeves and Co., Old Cotton, Norwich, for Roses.

SILVER-GILT BANKSIAN MEDALS.—Hewitt, Solihull, for Delphiniums; J. Peed and Son, Norwood, for stove and greenhouse plants.

SILVER FLORA MEDALS.—Hon. Arnold Henderson, Writtle Park, Chelmsford (Gardener, Mr. E. H. Starling), for Sweet Peas; Stark and Son, Fakenham, Norfolk, for Poppies and other hardy flowers.

SILVER BANKSIAN MEDALS.—J. A. Christie, M.P., The Manor House, Framingham Pigot (Gardener, Mr. Sam High), for hardy shrubs; Baroness Cederström, Hoveringland Hall (Gardener, Mr. F. Tweed), for annuals and biennials; Samuel Wallrock, The Manor House, Stanmore (Gardener, Mr. W. H. Holloway), for Sweet Peas; Mr. G. W. Miller, Wisbech, for a mixed group of herbaceous plants and Roses; Isaac House and Son, Westbury-on-Trym, for Scabious and other herbaceous plants; Lowe and Gibson, Ltd., Crawley Down, for Delphiniums and Border Carnations.

SILVER VEITCH MEMORIAL MEDAL.—G. L. Lang, Great Plumstead Hall (Gardener, Mr. F. Sheldrake), for Delphiniums.

BRONZE VEITCH MEMORIAL MEDAL.—Gordon Winter, Wramplingham, for seedling Pinks.

Cynoglossum cashmerianum

The plant which received the Royal Horticultural Society's Award of Merit on June 11th under the above name has now been identified as Cynoglossum nervosum, Benth.

Rhododendron Houlstonii

On June 25th a Rhododendron received an Award of Merit when shown under the above name. It has since been found that the plant exhibited was really a form of Rhododendron discolor, and, as it is not an improvement upon the forms of Rhododendron discolor which have already received awards, the award made on June 25th has been cancelled.

Successive sowings

Considerable care has to be exercised in small gardens to avoid waste in connection with those vegetables that have a comparatively short life and that are soon over after coming to maturity. It is a pity to see breadths of things like Cauliflower and Lettuce "running away." One can have a continuous supply of nice little Cauliflowers through several of the summer months, even in small gardens, but the essentials are a small variety like Dean's Snowball, successive sowings in March, April, and May, and only sufficient put in at each planting to meet requirements. So, too, with Lettuce, a row of four or five yards will yield quite enough for a small household. If sown in watered drills the seed soon germinates, and a second and third sowing can be made when plants from earlier sowings are well on the way. Golden Queen and Continuity are two of my favourites.

E. B.

REMINDERS FOR THE WEEK

Southern and Midland

Spring Cabbage

The time has arrived when the first sowing must be made in shallow drills, drawn at 9 inches to 1 foot apart. Should the soil be dry at the time, the drills should be watered before sowing the seeds; germination will then be a matter of days only. Protect the young seedlings from birds. Excellent varieties are Flower of Spring, Watkin and Simpson's Early Market, Early Feltham, and Ellam's Early Improved.

Carrots

In many instances the main crop sowing has failed owing to the persistence of the Carrot Fly, and where this has occurred I advise a sowing at the present time to provide sweet young Carrots for use during autumn and winter, the fly rarely interfering with these late sowings.

Parsley

Make a good sowing to stand the winter and to provide strong plants to fill a cold frame.

Globe Artichokes

Those which are fruiting freely require the assistance of liquid manure, such as the drainage from farmyards or diluted artificial. Cut away all old heads which have gone too far so as to enable the later heads to develop more freely, and, where possible, place a mulch over the roots.

Early Potatoes

Most of these are ready for lifting, and in doing so select the best tubers of seed size for next season's use and leave these latter on the ground for a few days to become thoroughly ripened and hardened, following which they must be placed in a cool store and examined from time to time.

Turnips

Make a good sowing to provide roots during winter, and through their early stages keep well supplied with water. If fly becomes troublesome, spray with Quassia Extract.

Winter Greens

A final survey should now be made in order to make good any failures which may have arisen from the various causes to which such plants are subject, and make a final planting of Celery for late use.

Chrysanthemums

Growth being free and vigorous, the question of staking must be considered, and few better methods exist than that of straining a stout wire from end to end of each row of plants and stapled to one or two intermediate posts as well as at each end. The tallest stakes supporting the plants may then be secured to the wire, the height of which must be arranged according to the height of the varieties being dealt with. They will then run no risk of being blown about, and may be syringed with vigour. Watch for insect pests and combat them. Late struck plants for flowering in 6-inch pots should now be finally potted and staked.

Peaches

Trees which have been relieved of their fruits may be thinned without delay. The removal of such wood as will be no longer required will allow sun and light to penetrate and harden the present season's growth, and although such pruning is not final, it is an undoubted advantage. Syringe such trees vigorously every afternoon and keep their roots well supplied with moisture.

Perpetual fruiting Raspberries

Tie in the strong young growths, as these will shortly be coming into bloom, and on no account permit the plants to suffer for want of moisture at their roots. A good heavy spraying overhead late in the afternoon will also be found most beneficial.

Rambling and other Climbing Roses

Train in the desired number of vigorous young growths now appearing from the base and cut clean out those remaining, as nothing is gained by overcrowding the supports. Remove old flowers when their beauty has expended itself.

Wistarias

Perhaps the most handsome and graceful of hardy climbers, these are developing numbers of streaming young growths which, unless required for extension purposes should be cut back to within four or five buds of their base and thus force the plants to become spurry and ultimately more floriferous.

Sweet Violets

Keep these well supplied with moisture and damp overhead in the cool of the evening, using a little soot in the water at intervals in order to hold Red Spider in check and improve the colour of their foliage.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Roses

Many Rose beds this year are anything but satisfactory, for even where plants were not entirely killed, they were so crippled that the growth is relatively feeble, and flowers in consequence smaller than usual. Considerable relief can be afforded the bushes by vigorously thinning the buds while still in a small state, while vermin must, of course, be kept under. Doses of liquid manure, not too strong, will greatly help for later bloom.

Sweet Peas

These popular annuals are for the most part exceptionally fine this season, and as growth is now very rapid, frequent attention in the way of training, tying, and thinning-out of the shoots is necessary. Moisture at the roots is also very necessary if the plants are to continue in health. Where the plants are not growing well some stimulant must be given if size of bloom and length of stem are to be maintained. Do not, however, overdo the feeding, for too strong and too frequent doses are certain to do more harm than good.

Border Carnations

The layering of these should be begun as soon as the plants are fit for this operation. All varieties are not ready at the same time, so it is well to take each when in good condition rather than wait for all to be fit. By doing so the work is less tiresome and the results are usually more satisfactory.

Border Chrysanthemums

These grow very rapidly at this season, and frequent attention in the way of tying and regulating the shoots is necessary, while disbudding of the earlier varieties must not be neglected where large flowers are desired. In dry weather an occasional soaking of clean water is very beneficial, while, should the plants be making only moderate progress, a little good artificial fertiliser sprinkled over the surface and hoed in just before w takes place will greatly help the s colour of the flowers.

Begonia Gloire de Lorraine

This pretty winter-flowering subjec looks better than when grown as a plant in a moist, rather warm house. two-year-old plants make the best plants as a rule. They need not, should not, be planted in the bask have the pots (the 7-inch size is very s hung up. Attend carefully with wat water, and weak liquor manure, pic all flower-buds as they appear until

Statice profusa

This is a most satisfactory subject cool greenhouse and conservatory an at all difficult to manage. It is so difficult to root, however, when the are taken from old plants, but side broken off with a "heel" from vigorous plants root quite readily. L is also a certain method for increasin and may be carried out now.

Eucharis amazonica

This lovely subject has been great lected of late years, and yet it is one very finest of warm-house plants. Li bulk of flowering plants, it must period of rest if it is to bloom well ensure this the pots should be move house with a temperature 10 degrees degrees lower, while water must be very sparingly. From three to four w this treatment will provide the necessa and the plants can then be returned t usual position and given plenty of wat occasional doses of weak liquid manur

Sowing Onions

The time for sowing this crop vari siderably, as there is so much diver climatic conditions. In the later d about July 20th will be found a favo time, while in the sheltered and milde as late as the middle of August will giv results. Trebons and Danver's Yell very good varieties for autumn sowin quite as hardy as the varieties usually a for this purpose.

Lifting early Potatoes

There is no advantage in allowing to remain in the ground after they ar so an opportunity should be taken to them dug up and stored. If "seed planting next year be required, sele more shapely medium-sized tubers and shallow boxes, setting these in full sun to thoroughly "green" before storing in a cool yet frost-proof shed.

Harvesting Shallots

These are so apt to start into growth if left in the ground after they are rip it is necessary to have the crop harvest moment this stage is reached. Lay the on a hard, dry surface in full s thoroughly mature before placing in net and hanging in a cool, dry, and airy pla the winter.

Dwarf Beans

Late sowings should be well thi should this be necessary. The plants s not be closer in the rows than 9 inches inches. Watering may be neces especially on light soils, while plants co into bearing will be greatly helped i occasional soaking of liquid manure be

The only cure is to lift, and replant on fresh ground which ot grown any of the Primula species least three years. All diseased por- should be cut away with a sharp knife he parts well dusted with powdered al.

ces failing

B. Craven).—We have carefully ned the specimen of Phlox sent, an find no trace of vermin. The of the stems have some appear- of having been attacked by wire- s, but we can find none of these de- ive creatures. The plants appear to been well grown, as the stems are but they are very dwarf and showing prematurely. You have not been ng strong stimulants of any kind, have The Phlox dislikes drought, but the rance of the plant hardly points to its g suffered from a too dry root-run. could, however, try what a thorough ng of water at the roots would do to them.

re and treatment for Anemones

U.).—Most of the wind flowers enjoy m, sandy soil which is of fair quality. however, will require heavy manuring. e any of the spring-flowering kinds show of exhaustion they should be lifted, l, and replanted in warm borders ally, although a few love partial shade. include A. appennina, A. Robinsoniana, palmata, etc. If healthy, there is no ion to move them, and there is little can do until February, when a top- ng of bone-meal or artificial manure be given with advantage. The peren- A. pulsatilla, A. sulphuræ, A. rivularis, imilar kinds will benefit from a sprink- f bone-meal around their roots during owing season.

hocks diseased

at can I do for Rust in Hollyhocks? any use spraying with soft-soap and in, or must I scrap the lot now? Can lant with healthy stock at once, or has round to be treated? H.

nmouth.

is is a fungoid disease and is best com- by spraying with Condy's Fluid, Bor- Mixture, or a salt solution every 14 Use a breakfast-cup full of common o 3 gallons of water. Employ an Abol syringe with a fine mist-like spray so that the mixture does not reach the roots of the plant. Messrs. Webb and Brand recommend the following: Slake 1 bushel of lime and when cool add 1 bushel of soot, 4 lbs. flowers of sulphur, and 2 ozs. sulphate of copper, finely powdered. Pass the mixture through a fine sieve and dust the plants well over with it three or four times during the growing season and when the leaves are damp.]

Name and approximate price of Lily and time for planting same

(A 30 Years Reader).—The flower you send is that of Lilium umbellatum, an easily grown Siberian species. The bulbs should be planted at about 5 inches deep and in good turfy and leafy soil during August and September. The price per dozen is about 7s. 6d. to 9s. 6d.

Various points

Please give me cultural hints for treatment after blooming for the following: Sunroses, creeping perennial Phlox, and Alpine dianthus. Some of my Pansies shrivel and are either rotted or eaten off just below the soil's surface. My Sweet Williams have done better this year. I put lime rubble at the roots when planting out last autumn, but some have still turned yellow-leaved and died. Can you account for the above? Kindly give me aspect, soil, and winter treatment for the small, scarlet, creeping Verbena. "IGNORAMUS."

[(1) The three first-named should be cut over immediately flowering has ceased; that is, the old flower-stalks should be removed down to the foliage, and if it is necessary to curtail the growth of either, the present is the best time to do so. (2) Pansies. This is probably the work of eelworm, to check which Vaporite should be dug into the soil before planting. (3) Sweet William. Eelworm. Treat as advised for Pansies. (4) Verbena chamædryoides. A frame or cool greenhouse is necessary to winter this brilliant spreading Verbena except in our most favoured counties, when a south aspect is desirable, and even then a little straw or bracken should be placed over it during winter. Sandy loam is quite suitable.]

Seedling Delphinium

(G. S. Daykin).—It is almost impossible to give an opinion from such a minute example. The flowers were almost withered up on arrival. A good spray should be sent, and in this case should be packed so as to arrive as fresh as possible. We do not, however, think that with such magnificent examples now in commerce that—except for the length of flower-spike, which appears to be exceptional—it bears any unusual character. You might like to consult one of the Delphinium specialists, such as Baker, seedsmen, Wolverhampton, or Hewitt, Solihull, Birmingham.

ROSES

Rust and Black Spot on Roses

(Seven Rides).—Spray the bushes every 10 days with Bentley's Anti-Rust, using a fine Abol syringe for the purpose and taking care to thoroughly wet the under-sides of the leaves. This may be obtained from J. Bentley and Sons, Barrow-on-Humber, Lincolnshire.

Rose leaves for inspection

(A. T. W., Berks.).—This is the work of moths and their maggots, the former laying their eggs on the foliage, and the resulting larvæ obtaining their sustenance on the leaves or flower buds. Hand-picking during May is the usual remedy, the maggot being found between the leaves after the manner of that of the Celery Fly, and careful crushing with the thumb and finger will exterminate him. Another remedy, and a more expeditious one, is to syringe the plants immediately this pest is discovered, with quassia and nicotine, repeating same once each week until it is stamped out.

TREES AND SHRUBS

Shoot of Willow

(Mrs. Ragg).—The reason why your Willow continues to fail is drought. Willows love their toes in the water and rarely flourish on the fringe of artificial pools cut out of stiff clay soils which are liable to drop to low levels in times of drought, as, unlike the sides of old rivers where water is constant and moving and the sides composed of centuries of loose silt, the sides of artificial ponds are usually solid and unsuited to the culture of Willows. As you value the tree, we advise you to plant it in a variety of positions until you find out in which part of the garden it seems most at home. Also paint the trunk every fortnight with paraffin soap or paraffin emulsion (obtainable from horticultural sundriesmen), using the directions given by them.

Obtaining and raising trees and shrubs from seeds

(C. S. Gordon Smith).—(1) Either of the following would prove of great assistance to you: "Shrubs for Amateurs," by W. J. Bean, price 5s. 6d., or "Trees and Shrubs Hardy in the British Isles," two vols., £3 4s.; the latter a remarkably fine standard work and one of the most reliable in existence. (2) Tree and shrub seeds are offered by very few nurseries in this country. Thompson and Morgan, seedsmen, Ipswich, however, offer a few, but Vilmerin et Cie., 4, Quai d' la Megisserie, Paris, offer a fairly large list, and we advise you to write and ask for it, stating your particular requirements. A few Conifer seeds may be obtainable from Ben Reid and Co., of Aberdeen.

Erect trees for wind-swept garden

(Lady Rosamund Christie).—We do not know of a bronze Cypress, but this colour is developed to a very large degree in the late summer and during winter in Cryptomeria japonica. It is then very beautiful, and would thrive with you, but is, we fear, rather too spreading in character for your purpose. You are probably aware of the golden, erect Irish Yew. Then a very lovely, erect-growing tree is Cupressus macrocarpa and its golden variety lutea. There is also a very erect variety of this tree called fastigiata. There is also the Red Cedar Juniperus virginiana, a rather small tree with a close spire-like figure and of a pleasing green aspect. Cupressus macrocarpa in one of its forms would, however, be the most suitable tree for your purpose. The heeling over could only be prevented by placing a stout wire around the trunk of the tree and straining it to a stump in the ground, or, if this is not possible owing to such a wire coming across the path, then erect two posts at the nearest possible point and fix two horizontal supports from them to the tree, and on the side where pressure is greatest. A small ring of felt should be secured around the trunk where the ties are to be made.

Rhododendron leaves for examination

(W. H. Mason).—There is nothing whatever wrong with the leaves you send, the numerous brown hairs on the young leaves being perfectly natural to this particular species. You will notice that few or none remain upon the older leaves, and the same will apply to those now developing as they age and harden. We should say that the shrub from which the leaves were taken was quite healthy. Quite a number of Himalayan and Chinese Rhododendrons have this hairy character when young.

FRUIT

Peaches discoloured

(" Under-Gardener ").—As regards the discoloration on the Peaches, there must be some cultural mistake. Syringing with water containing lime or iron would cause the brown spots. So would the use of too strong insecticides. Another probable cause would be syringing in the morning with the house close shut, the sun striking on the fruits while drops of moisture are hanging from them could easily cause the mischief. It is likely that the branch of the Nectarine tree that is showing signs of distress is suffering either from " gumming " or " canker," all " stone " fruits being specially liable to these diseases. In either case cut away the dead branch and dress the wound with styptic or painters' " notting."

Fig leaves

(W. P.).—The leaves were so dry when they reached us that we are unable to get much guidance from them. Have the roots at any time got dry? If so, this would go far to cause the trouble. The leaves looked as if they had been attacked by Red Spider, but in their dry state we could discover no trace of these pests. The Fig in growth demands copious supplies of water at the roots, and after the fruits are set and swelling, occasional soakings of weak liquid manure is beneficial. You err in syringing with cold water. It should always be slightly warmer than the temperature of the house.

Shot-leaf fungus in Peaches

(J. McK.).—All badly affected and fallen leaves should be carefully collected and burned, and in spring the trees should be sprayed with Bordeaux Mixture. Permitting the trees to get dry at the roots is very bad for the Peach, and this has doubtless helped to encourage the fungus. It is not at all certain where the spores of this fungus pass the winter, but you would do well to thoroughly cleanse, or better still paint, the whole of the wood-work during the winter.

Plum tree not flowering

(A. M. Cunnington).—There are two reasons why your Plum tree does not produce flowers. (1) It may be that birds pick out the buds (a very common occurrence) during the winter when the branches are bare. This you can prove by netting or protecting the tree in some way next year. (2) The tree may be growing too vigorously, making a lot of rank, fruitless wood, in which case we advise you to take out a small trench in a circle around the base of the tree and at 2 feet 6 inches from the tree trunk. This should be about 18 inches wide and 2 feet deep, severing all roots contained therein, and after cutting the severed ends clean with a knife, fill in the trench, and make firm. This will have the effect of checking exuberant growth and bring the tree to a fruitful condition.

Cordon Gooseberries failing

(H., Monmouth).—This trouble occurs from time to time among Cordon Gooseberries and is due to cankering of the wood. No remedy is so far known, except that of cutting away the affected branches and the training in of new, strong basal growths to take their place. As soon as the fruit is gathered the trees should be sprayed with Bordeaux Mixture. In the case of old specimens it is better to cut or dig away the plants altogether and renew both soil and plants. The ground should be trenched 2 feet deep at least and enriched with manure. Such trees often get exceptionally dry at this season and should receive periodical soakings of water.

Making a new Strawberry bed on the site of an old one

(M. A. Pilkington).—Of course it is much better to make a new bed on entirely fresh land, but under the circumstances we consider that if you trench your soil to a depth of at least 2 feet, incorporating a good quantity of well-seasoned farmyard manure, together with a light dressing of bone-meal in the last 8 inches of surface, you should obtain satisfactory results for at least 3 years. The Strawberry you mention is excellent in every way, although its flavour varies slightly on different soils.

Strawberries unsatisfactory

(Mrs. Howard Coote).—There was no trace of disease upon the plants you send, and we suggest that the cause of weakness in the leaves and fruits is due to lack of nourishment. As soon as the fruits are gathered, remove all runners and give the plants a mulch of farmyard manure and an occasional soaking of water. You are probably aware that land for Strawberries should be dug two spits deep and plenty of farmyard manure incorporated with the soil, as they remain upon the same ground from 3 years to 5 years. We can give no reason for the fruits being so small other than the above.

Morello Cherries

(Mrs. Howard Coote).—Drought is probably responsible for the dropping fruit, and we advise you to soak the trees thoroughly. Trees on such walls have in some instances suffered severely in this way this year, both on north and east walls, watering having to be carried out once every week to retain the crop.

VEGETABLES

Gaps in Asparagus bed

I came to this garden 2 years ago last March and immediately made an Asparagus bed. I bought Sutton's 4-year-old roots, had it well prepared, did not cut at all the first year, very little last year, and expected to have a good crop this year, but though some of the stalks are quite excellent, there are gaps of 7 feet or 8 feet with no growth at all, and in other places only a very weak, spindly growth, and the number of edible stalks have been very, very few. It was heavily manured with seaweed this winter. As this garden is on a mountain side I put it at the bottom, thinking it would be more moist. Immediately above the top row of Asparagus is a row of rampant Raspberries and they throw up suckers all over the Asparagus bed, so I think this may have something to do with it. I propose taking up the row of Raspberries this autumn. Do you think I should replant the gaps in March, and is it the weakly growth seedlings which should be removed, as advised on pa
and how should I manure it now?

" SEVEN RI

[We advise you to remove the Rasp as soon as possible and fill up all spaces in the Asparagus bed at the March with two-year-old plants, dis entirely those which have failed to r At the present time you might give a light sprinkling over the surface wit mon salt, and in a fortnight's time with diluted manure, such as the d from farmyards or a similar manure m dissolving a small quantity of artifi water and then diluting same before a it to the plants.

MISCELLANEOUS

Coarse patches in lawn

(Landway).—It is advisable to rem turf from the patches in question, the soil beneath to a depth of 1 foo after firming down add a surfacing o loam to take the place of the turf re Firm this, rake the surface fine, and s seed. The last week in September o in October is a good time for sowing. to clip Yew hedges, the end of July.

Mealy bug

(M. H. W.).—As summer treatmen cure some spirits of wine and with a hair brush go systematically over the and wherever any of the vermin is touch it with this liquid, not omitti little tufts of white, woolly material contains the eggs of the pests. Thi grant considerable temporary relief. the leaves fall, prune the Vines, burni the prunings. Next go carefully ov rods, rubbing off all loose bark. The of the house should then be scrubbed warm water and soft-soap, all brick whitewashed, and any cracks cement All loose debris should be then swe and immediately burned. The Vines s then be carefully painted with a strong tion of Gishurst Compound, working i into any cracks, but taking care r damage the eyes. All this will help, spring keep a sharp look-out for the e and again have the spirit of wine h and by repeatedly hunting for and de ing every insect seen there should b little trouble with the vermin getting a the berries.

Ants in Melon frame

(Eleanor Pain).—We advise you to the Acme Chemical Company's ant beetle destroyer, which is harmless to thing except insects. All crawling in such as ants, steam flies, crickets, etc., disappear when this remedy is adopted. you have to do is to place the destroyer the spot where the ants are known to The price is 2s. each. The address is Acme Chemical Company, Ltd., Tonbr Kent.

Soil for examination

(Melon).—We find nothing whatever i soil you send which would cause the rot from which your plants are suffe This is due to faulty management, and no means uncommon, especially w Melons have to be entrusted, to a larg tent, to young and inexperienced men. much water about the stem and too l temperature, with the plants and foliage at the same time will set up this tro Maintain a higher temperature, and do water within 4 inches or 5 inches of the s over which a dusting of lime should shaken. We would also advise you to a little slaked lime to any future mixing of as it appears to be deficient of this.

Mildew

G McKeown).—From what you say, it ly probable that mildew is at the root trouble, but not seeing the affected we concluded that the fly was re- nble, as this latter pest has been most some this year, but wherever the is at work, Onions will be found to maggots. Remedy: Damp the foli- nd then dust freely with flowers of r, or spray the plants with Mildew c such as that offered by Messrs. ty, Barrow-on-Humber, Hull, the price 3s. 6d. per quart, this being sufficient ke 20 gallons of wash. It is a very and effective remedy.

NAMES OF PLANTS

C., *Devon.*—Campanulas to name. s too far gone to be certain of them, bably variable forms of C. cæspitosa.

C., *Devon.*—1, Sedum Sieboldi; 2, spurium; 3, Sedum spathulifolium; um obtusatum.

Mills, Belfast.—1, Hypericum reptans; panula garganica hirsuta; 3, not re- d.

B.—Olearia semi-dentata.

F., Dartford.—Phlomis fruticosa ia Digswelliana).

Muriel Jex-Blake.—Allium Ostrow- m.

-Delphinium F. W. Smith.

—It is not possible for us to name oses. One is a Moss Rose and the first cross between a garden Rose species. There were thousands of rosses raised 50 years ago, many of found their way into gardens. They ther nameless or, if named, have been n.

E. Smith.—Habenaria virescens r Butterfly Orchis).

J. M.—Veronica spicata.

A. K. H.—1, Nepeta macrantha; 2, N. Mussini; 3, Cotoneaster Francheti.

Mrs. Annan Bryce.—1, Polemonium Richardsonii; 2, Lychnis chalcedonica; 3, Potentilla argyrophylla; 4, Orobus niger; 5, Lychnis flos-Jovis; 6, Olearia nummularifolia; 7, Indigofera Gerardiana.

"*Marmion.*"—(1) Calceolaria polyrrhiza; (2) Campanula abietina; (3) Dianthus plumarius fimbriatus; (4) Dianthus Fettes Mount; (5) Trachelium sp.

LATE REPLIES

Pruning Jasminum officinalis

(V. L. M.).—This fine shrub should be left entirely alone as long as possible; it will then bloom with the greatest profusion. When something must be done owing to its having outrun its allotted space, it should be thinned out, *i.e.*, the poorest and weakest wood removed just sufficiently to allow of sunshine and air penetrating its branches, leaving a goodly number at their full length, as it is these growths which produce the flowers. To prune this lovely climber after the manner of Roses, etc., is to cut away all —or most of—its flowers.

Raspberry Caterpillars

(Merlin).—The specimen Raspberry leaves are attacked by a species of Sawfly, but as most of the specimens were dead on arrival we are afraid we cannot breed them through to find out the exact species. We remember seeing this or a similar Sawfly doing the same type of damage to Raspberries in a Somersetshire garden, but failure resulted in the attempt to get the larvæ through to the adult stage for purposes of identification. We do not think that the pest is a common one, at least in England. We think that if you leave the pest until the fruit is gathered the larvæ will be fully fed and will have gone down to the soil to pupate. In any case spraying would not be of much use because the larvæ appear to tunnel in the leaf, and in such a position are protected. A wash containing nicotine might kill them. If it is practical, we should advise you to go over the attacked plants and cut off the affected foliage at once and burn it. A dressing of naphthalene at the rate of 2 ozs. per square yard applied to the soil in early autumn would account for many of the creatures. Dig the naphthalene in as deep as possible without disturbing the roots.

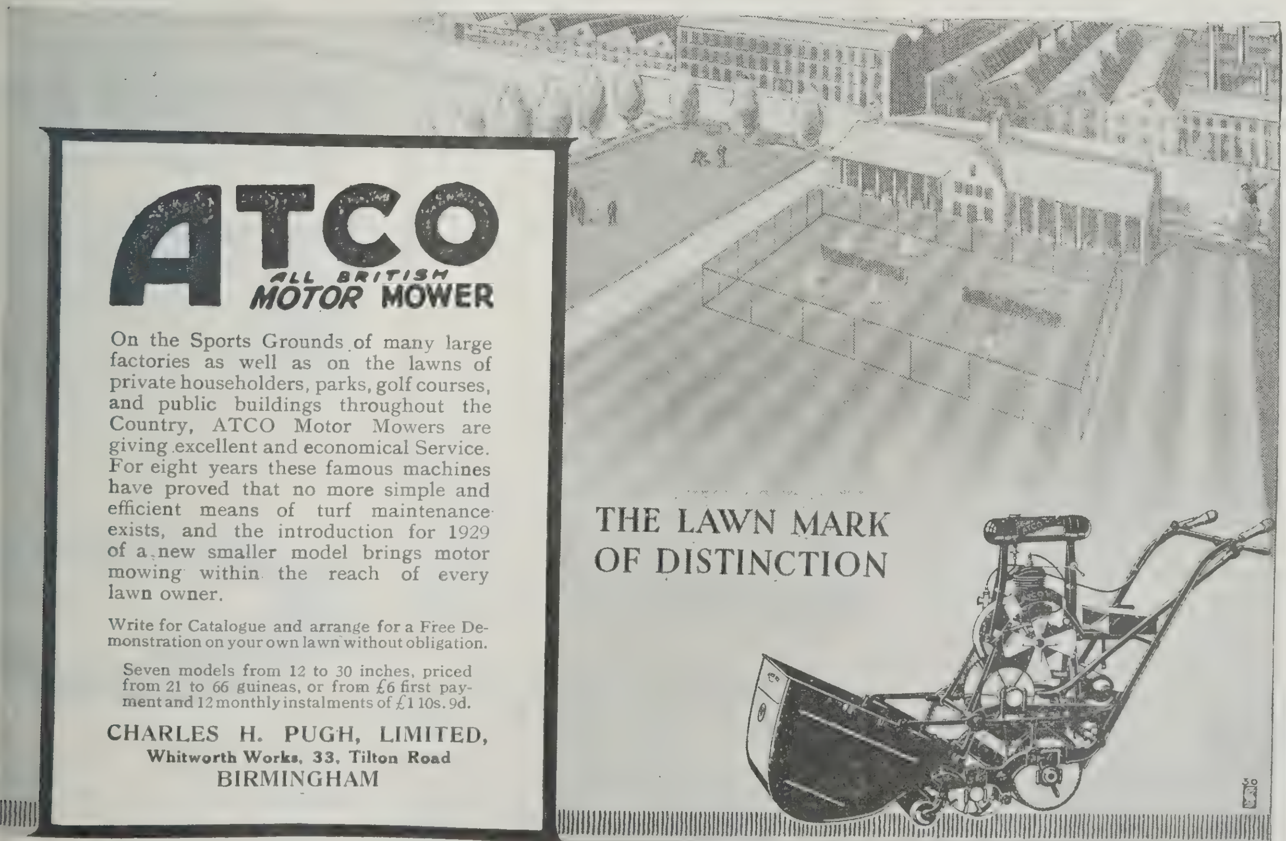
SHORT REPLIES

Naphthalene.—For the destruction of all insects, wireworms, leatherjackets, millepedes, etc., naphthalene should be dug or worked into the ground a little below the root depth before sowing or planting. The fumes will then destroy these pests. For surface insects, etc., it should be sprinkled over the surface, raked in, and watered with a rose.

A. Donovan. — Stump-rooted Parsnip wanted. Messrs. Ryder and Sons, seedsmen, St. Albans, Herts.

B. Brandreth, junr.—*Re* Primulas. Try Messrs. J. Stormonth and Sons, Kirkbride, Cumberland, or Mr. G. H. Dalrymple, Bartley Nurseries, Southampton.

F. G. Barron.—You should write to Farm and Garden Universal Fertiliser Company, 415, Smithdown Road, Liverpool, or to one of the border Tweed mills, say, R. G. Tait, Slitrig Mills, Hawick, or Peter Anderson, Bridges Mills, Galashiels, as there is always plenty of waste wool at these places. For good, healthy plants of Meconopsis and Primulas of all kinds, apply to Messrs. Oliver and Hunter, Moniaive, Dumfriesshire.



THE LAWN MARK OF DISTINCTION

ATCO
ALL BRITISH
MOTOR MOWER

On the Sports Grounds of many large factories as well as on the lawns of private householders, parks, golf courses, and public buildings throughout the Country, ATCO Motor Mowers are giving excellent and economical Service. For eight years these famous machines have proved that no more simple and efficient means of turf maintenance exists, and the introduction for 1929 of a new smaller model brings motor mowing within the reach of every lawn owner.

Write for Catalogue and arrange for a Free Demonstration on your own lawn without obligation.

Seven models from 12 to 30 inches, priced from 21 to 66 guineas, or from £6 first payment and 12 monthly instalments of £1 10s. 9d.

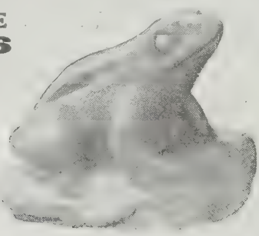
Display Successional Blooms in "LEFCO" VASES

With the passing season blooms fade; the early Spring flowers die before the later flowering plants are budding, and your garden needs the continuous colour supplied by successional blooms tastefully displayed in "Lefco" Vases. At the head of the steps, at path intersections, or happily placed on lawns or terraces "Lefco" Vases lift to the sun succession after succession of bright blossoms, making your garden always gay.

There are a dozen charming designs in "Lefco" Vases, all of them moderately priced, ranging from 22/6, all of them described and charmingly illustrated in our inspiring booklet, sent you free on receipt of the coupon below. Remember, "Lefco" Vases are made of the permanent "Lefco" ware. They will not crack nor crumble. They stay beautiful always. Send to-day for the book of garden ornaments which gives you half a hundred hints for beautifying your garden. Use the coupon below.

PRICE 2/6 POST FREE



Special Sample Offer
"LEFCO" Miniature
Figures No. 1
THE FROG

This quaint "Lefco" piece stands 3 in. high. In addition to its use in the garden, it forms a really admirable paper-weight or mantel ornament. Made of the famous "Lefco" Ware, it will not crack; a wipe with a damp cloth will remove any dirt. Charming, useful, and very low in price. Obtainable only from the makers. See the mark on every piece of "Lefco" Ware. It assures you that it is genuine and British made.

Purity Fertilizers

How do you buy
your BONEMEAL?
FOR immediate and complete assimilation by the roots of your flowers, fruit, and vegetable crops, you need a really pure bone meal; one guaranteed to contain no residue or added matter of any kind. Derrick's 100% pure bone is rich in phosphoric acid, phosphate, nitrogen, and lime; has all the constituents of a perfectly natural fertiliser, and no waste or slowly disintegrating matter. Unequalled for all horticultural purposes.

Roses That Excel

id-July we are at the zenith of enjoy- t of our Roses, and the season is ably the best of the year for Rose es. I know nothing better than Etoile Hllande, which, although a little thin t too free, only has one rival in Bed- imson, which has more substance and with just as good a scent. This is a r grower. The next best is Chateau de ougeout, the darkest of all Roses, but short grower that only those with a oil should attempt it, and then it must pined to an eye looking upward to tract its spreading habit.

ve always said that rins, both amateur and eional, had missed the pik Rose grown—Rose There is a life about non rose-pink petals, vetness in its scent celled, combined rm and freedom of eng, in any other e. Do not expect a ush from a nursery- It does not make a e-year tree, but is a rower when once it lished in the garden. xt choice of a pink alls on Briarcliffe and ia (see illustration), gh Dame Edith Helen es a finer flower.

brilliance of colour, oses excel Comtesse tillija; it is deeper in han Angele Pernet, xcept in scent, a rRose. Chas. P. Kil- s a finer shape than I would regard it as less Rose if it had a cent. Wm. Kordes in perfume. One ove all these varie- ith their fascinating of orange and pink; one leave out Shot lthough its form is good.

r the yellows, I love ll. Golden Emblem, of its winter deli- lorence Izzard, better and so much like the Mabel Morse; Gol- leam and Ville de most vivid of yellows; and, perhaps best of all, Julian Potin. Yet these do not include Souvenir de Mme. Boullet, most elegant of all yellow varieties with a softer shade, nor Rev. Page Roberts and its sister Mrs. Beatty.

We hear some people say they do not like white Roses, but this would never apply to the exquisite Clarice Goodacre. Of course, everyone loves Mme. Butterfly, although it is a little untidy, but no variety beats it in the shade, although I prefer its more deeply-coloured sport, Lady Sylvia.

Of many favourite Roses, who can forget Ruth, a flower so full and good of orange and apricot shade, carried on a short bush? Or of that wonderful full and gorgeous pink shot with orange, Souvenir de Georges Pernet, that visitors to the Folkestone Rose Garden could not fail to see? It has not perfect shape, but for a display of really fine flowers is unrivalled.

For a stately, perfect flower, Lady Dixon Hartland is a variety many rosarians have overlooked. Each individual flower comes blameless, of a light salmon-rose-pink.

Not many of the Roses that I love are found among the singles, but Isobel is sweetness personified, of a reddish apricot, shot with orange and pink. Hawlmark Crimson and K. of K. are somewhat similar, but for lovers of a dark single they are supreme.

Just now the climbing Hybrid Teas are at their best, although at Rose Shows one does not see them to advantage. It should never be forgotten that Roses vary somewhat in different districts. It is a good plan to see them growing at the nearest nursery to one's garden, for the growth and habit of a variety are not the least of its important points.

A. Swallow.

Columbia, one of the best of the many pink Roses

Notes of the Week

The drought and garden watering

We have all noticed the urgent request of the Minister of Health that consumers of water shall exercise strict economy in its use during this unprecedented period of drought. Mr. R. W. James, the Vice-Chairman of the Metropolitan Water Board, in a statement made to his Board on the 5th inst., pointed out that the amount of water used through 500 ½-inch hose-pipes playing for 24 hours is equivalent to the normal daily consumption of 30,000 persons.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

The desert garden

THIS has done very well, and in the absence of rain is beginning to justify its name.

A photograph of Potentilla nitida shows how well this class of plant does in the dry, stony soil. There are two varieties of this Potentilla, one of which is supposed to be more floriferous, but personally I find little difference; the white form also does well.

To the desert garden we have added a sand garden with 2 feet of river sand. Here the various Oncocyclis Iris hybrids and other hybrids raised by Professor Mitchell, of the University of California, including William Mohr and Cherokee Maid, are doing remarkably well, as are also Corallospartiums and Chordospartiums from New Zealand. Here, too, Venidium fastuosum grows best. In the border it has a tendency to get drawn, but in the sand it carries its flowers on relatively short stems and spreads out in all directions, making a most attractive plant with its great hairy buds and grey-green foliage. I have no hesitation in declaring this introduction of Mr. Hay's the best new annual which has appeared for many years.

William Lawrence.

Potentilla nitida, flowers bright rosy pink, in Sir William Lawrence's desert garden at Burford, Dorking

Meconopsis Baileyi

I can assure "J. R. K." that I am not in the habit of making statements unsupported by facts; neither do I lack experience of the climatic conditions of Yorkshire, for I had charge of a well-known garden in that county for some years before coming to North Wales.

When I wrote that Meconopsis Baileyi is perfectly hardy in any part of the British Isles, I used the word hardy in its generally accepted sense when applied to plant life, meaning that the plant is able to withstand cold, but perhaps "J. R. K." expects it to cover all cultural defects. I would remind him that there are other factors responsible for winter mortality amongst plants, and knowing the West Riding of Yorkshire as I do, I am fairly certain that, provided other cultural details are correct, winter damp and poor drainage is the cause of "J. R. K.'s" failure.

If my memory serves me correctly, herbaceous Phloxes winter badly in many parts of the West Riding from the same cause, but I doubt whether anyone would suggest that they are not hardy throughout the British Isles.

"J. R. K." is very emphatic in denying my statement, but can he as emphatically prove that Meconopsis Baileyi has been killed by frost?

Amongst Yorkshire gardens where I know that Meconopsis Baileyi is well grown, the Hon. Robert James' garden at St. Nicholas, Richmond, is perhaps the nearest to "J. R. K.," and he will find that they have succeeded there for several years.

In view of the strong expressions which "J. R. K." uses, it is a pity that he does not write over his full name, so that one knew with whom they are dealing. It requires small courage to make wild accusations under the cover of pseudonyms or initials.

F. C. Puddle.

Bodnant Gardens, North Wales.

—— It is rather surprising to read the note by "J. R. K.," on page 494, in which he takes exception to the statement of Mr. F. C. Puddle that this Meconopsis is hardy. I have had plants in flower this summer which stood in the open ground without protection all last winter, and I did not lose a single plant, although M. Dallichi was destroyed. I saw a nice lot of plants which had flowered in a Kirkcudbrightshire garden, and all had survived last winter's ordeal. It is also hardy in the uplands of Dumfriesshire, and I have had similar results reported to me from other parts of Scotland. I am, however, reserving my opinion regarding the perennial character of this Meconopsis. I
have been informed that there are two
one of which is perennial and the
biennial. I am disposed to think t
plants which have flowered will die,
present they show no sign of departu
are setting seeds well. S. Ar

Dumfriesshire.

A proposed Rock Garden Soci

With the exception of just one p
most cordially agree with and support
"A Scottish Gardener" says. Th
point alone on which I differ from
when he says that "to be effective,
garden must be of considerable area."
he falls into the error which is th
mark of estimates and suggestions
emanate from the comparatively few
men, which is exemplified by the exhi
great shows, and by the catering
authorities for big things and big
alone, to the exclusion and deprecia
the "small man." In the "small"
rock garden or rockery most, if not all,
difficulties suggested by a "Scottish
dener" automatically disappear. I
seen numerous rockeries and miniatur
gardens of the greatest beauty and in
and made from a few barrowloads
and a few stones, equally effectiv
successful as gardens of acres. And w
the most miniature of all the sink
troughs? Some I have seen have be
quisite in every detail and requiremen

Mr. Ernest Dixon, lower on the pag
the nail fairly and squarely when he
"Anyone can have a rock garden. F
3-inch pot to the Grand Canyon is
matter of size." Exactly, but I hav
hopes of a Rock Garden Society on
suggested by Sir William Lawrence
realising the fact so tersely stated b
Dixon, or being so broad-minded as
member that "any one can have a
garden," and a good one, unless it be
area, scope, ambition, and cost!

And, while it is true that Sir William
rence put in print the actual suggestio
is therefore entitled, I suppose, to a h
glory, no one with eyes to read coul
sibly fail to see whence he got it
how much he owed for his "suggestio
the pages of Gardening Illustrated
week or two before he put it forth!

Has Sir William Lawrence, or ha
dozen others such as he, any experien
small rock gardens or gardeners, or
save those of a comparatively few
men such as himself, that he and hi
porters alone should be allowed, if po
to carry the day as they will? Not
lack of knowledge, or of experience,
interest, is it that many of us, large or
fail to find a place in current comment
as this, but, perhaps, from the fact
largely through distance alone we are
touch with the vast seat of learning
in the clique of the favoured few who
think they represent the whole hortic
knowledge, experience, and opinion
country! But it is quite time that it
made known, for the enlightenment of
few "big" men, that there are
equally "big" in knowledge, exper
and weight of opinion, and thousan
others, despised "small" fry, who can
suggestions for rock garden societies
and who are not averse to carrying the
as well! J. R.

—— It is clear that a large numb
amateur and professional growers of
plants and the like would welcome a s
of this kind. I see that Mr. Mark Fe
protests against the multiplicatio
specialist societies, but this is an ine
result of multiplying the number of
in cultivation. Indeed, Mr. Fenwick h
suggested to me that at the Amateur

as s should be arranged for Campanulas, d might well be one of the tasks of the c Garden Society to arrange for a classi-d xhibition of Campanulas and similar an in connection with one of the R.H.S. os.

I ropose with your consent to return to e ıbject in the autumn and to arrange for eting of amateur and professional rs who are specially interested in the ltation of this class of plants. A well-on nurseryman is very anxious that ics should constitute one of the activi-s f the society, and personally I think is a good idea. WILLIAM LAWRENCE.

Heucheras changing colour

h reference to the query, issue July th page 489, as to all my Heucheras hav-g ecome a dingy yellow colour this year, y perhaps interest others to hear that t Royal Show recently I mentioned this t ee gardeners, all of whom were show-g glowing masses of this lovely flower gst their exhibits, and they all assured at it was caused by the drought! One er told me that all his plants had been rly affected one year, and that since e he had taken care to give them copious es of water before the actual flowering s commenced.

A s! I cannot follow this good advice, e have no water now, but it was re-s ng to be told that probably next year ants would flower "better than ever"!

M. F. REYNARD.

Cnp Hill, Bedale, Yorkshire.

Lilium Regale

O not know if you would care to pub-h this photograph of Lilium Regale. o bulbs were planted in their present sion in 1922. One of the Lilies is now e 4 inches high, and that one has three k with total of 34 flowers. The other is high (about 6 feet). It has two spikes, a of flowers 38. The one on the extreme t s a seedling from the tall one. Seed e in in 1925. Sir Thomas Royden, r, is standing beside the Lily to show its gt. He is 5 feet 9 inches tall.

QUENDDA M. ROYDEN.

Rke Hall, Chester.

Hemerocallis in woodland

T e excellent note on the above by Mr. W. t, on page 499, directs attention to the y of the Hemerocallis planted in o and. One point of importance has lbly been omitted inadvertently. This t t in some places that pest of many things—the rabbit—is very destructive e Hemerocallis, especially during the t ear. I know of at least two instances emerocallis being planted in large s in woodlands, and that after an in-v of years. In the first case the plants r cropped to the ground, but some of r survived and came up weakly the d year and were then hardly touched. e other instance the plants appear to been destroyed without any chance of ery. The rabbit has an uncanny taste velties, and in some places will destroy which in others they will leave abso-e alone. At Monreith the Funkias, for ple, are untouched, while in another I know the rabbits crop them to the d and soon eradicate them. I heard ther day of Trolliuses which had been d out and had been eaten also. The Mr. James Brown, of Knockbrex, Kirk-lightshire, was most anxious to estab-n his beautiful grounds the common which grows in abundance on the oppo-de of the bay, and where rabbits abound. s brought from this bay, and seedlings eds from the same quarter, were tried at Knockbrex, but the rabbits there gave them no chance of life, cropping them to the ground beyond recall. S. ARNOTT.

Re blue flowers

I should like to support everything Major Chappell says on page 280 on this subject, and to add my own strong condemnation of the looseness of description so prevalent, as in the article on "Blue-flowering Plants," by W. Auton. In that article, over and above Anemone hepatica and A. apennina, and the absurd reference to blue Aubrietia, there were, I noticed, at least half-a-dozen other plants mentioned which are very doubtfully entitled to the description "blue." I, too, should much like to know the name of the blue Aubrietia, but I fear that among all those of this family which "approximate" to blue there is not yet one with which I should dream of replacing the Forget-me-nots. Equally inaccurate, as Major Chappell suggests, is the reference to "Primroses from pale blue to deep violet."

Lilium Regale, over 7 feet high

Two spikes from one bulb carrying 38 flowers

As regards the accuracy of description shown by many contributors, I am afraid I cannot altogether agree with Major Chappell. I think this looseness in colour description is but one direction in which there seems to be a growing tendency towards inaccuracy by contributors, not only by comparative novices, but quite as often by those who reckon to know. Nomenclature is frequently far from correct, and, judging by many articles and letters which appear, there seems to be widespread confusion over the use and meanings of such terms as species, kind, variety. Plants are often written down, recommended as "absolutely hardy," which, in truth, are no more than half-hardy, until the use of the term "hardy" seems to be something of a habit.

Major Chappell advocates, and no doubt rightly, the establishment and use of a colour chart. But the root cure for much, but not all, of this laxity in colour description, and for much of the looseness shown in describing other features and characteristics is, it seems to me, a "return to facts." For there is a steadily growing tendency to get further and further from the fact. Two clear examples are found in this colour confusion and in the use of the term "hardy," and in each case departure from the fact would seem sometimes to be deliberate.

Blue is a comparatively rare colour, but at the same time most desirable in our gardens. To make up for this lack of blue plants the only thing appears to be, on the part of many writers and list-makers, to force in a number of purples, violets, and mauves. Is this an attempt to follow the catalogues, which are so unreliable on this, as on other points in plant description, or is it carelessness alone?

Again, almost every plant newly introduced is proclaimed by those who write of it and recommend it, and who reckon to know, as "quite hardy," irrespective of district or climatic conditions, or anything else. Quite one-half of the plants described by contributors as "hardy" are by no means so, save under the most special conditions. Are our gardens so short of "hardy" plants as to necessitate the almost universal forcing of "hardiness" upon many subjects which are by no means so?

The actual facts are that *this* plant is blue, or red, or whatever it may be, and *that* plant is "hardy" or "tender." Why cannot we be content and stick to the facts of Nature without attempting to impose upon them characteristics which are not theirs?

I have come to the conclusion myself that something else is of more fundamental necessity than a colour chart, and that it applies to other inaccuracies of description besides colouration. Briefly and bluntly it is, that many of those who aspire to contribute to horticultural journals should previously exercise their powers of observation with a little more exactitude than they apparently do.

Of those conversant with them, as we suppose the writers to be, it surely demands no great strain upon power of observation to realise that many of the plants described by them as "blue" are, as Major Chappell says, manifestly purple. If one cannot distinguish between purple and blue in the flowers themselves I fail to see the use of a colour chart at all.

As at least a partial cure for the prevalent and increasing tendency to looseness of description I would suggest that we *begin* by getting back to facts, and by using our power of observation with a little more care before ever we think of colour charts or any other "mechanical" aid. It used to be that a plant was "hardy" or not, now those which are half-hardy or less need but the pen of a misguided enthusiast to convert them to absolute and universal hardiness.

Flowers used to be blue, or something else; now, it seems, they may be any colour of the rainbow, according to whatever is necessary towards the "stuffing" of an article, or the filling of an all too abbreviated list. J. R. K.

Mechanical cultivation

I am pleased to see "Jack's" rejoinder to my note in connection with mechanical cultivation. There are two sides to every question—many men, many minds, and it is only by the exchange of opinions that in this, as in other matters, we can arrive at the truth. I do not at all complain of the excerpts which "Jack" has made from my observations, but I would point out that I fear he cannot have read carefully the question raised by "A. D. G. G." No doubt that gentleman is qualified to speak for himself. My recollection is that, specifically, he desired information not for the commercial gardens to which "Jack" refers, but for a private garden in order that the latter may "pay its way." "Jack" tells us that on soil which is partly hard and partly soft a motor cultivator cannot be expected to cultivate evenly, and in such a case it is the usual practice to go over the work twice. I may be "dull in the uptak'," as we Scots say, but I really fail to see how going over the soft places twice is going to improve matters. Nor is it customary to entrust expensive machinery to the "garden boy," as "Jack" evidently thinks, and "half-an-hour's instruction," which, as he tells us, "is sufficient for most beginners," is liable to arouse the risible faculties of others than the garden boy.

The Pennsylvania lawn-mower, or the Planet, Junr., cultivator, hand-propelled, are more usually the implements entrusted to that tyro. "Jack's" admission that he has not met with a motor cultivator that will trench a piece of soil or dodge in and out among fruit bushes was entirely unnecessary —neither has anyone else. And he would be sanguine who would expect such a cultivator to attend, even in the experienced hands of the garden boy, to the herbaceous border. Horse labour in ordinary private gardens, such as those to which I made reference, has not ousted, and never will oust, the spade; much less will motor labour, despite the fact, which I freely admitted, that gardeners are the most conservative body of craftsmen almost in the world. In spite of "Jack's" quite reasonable note I yet adhere to my expressed opinion. A sudden doubt assails me. "Jack" does not directly tell us that he has had personal experience—as I have had—of motor cultivation, but he says (I quote): "Let me plead with all inquirers, such as 'A. D. G. G.,' to get into touch with the various firms who make motor cultivators and allow the firms concerned to show them exactly what the various cultivators can do." (Rather a big proposition, by the way, for obvious reasons!) "The result will surprise *Spade Lovers*." (Why, may I ask, the italics?) "The writer's job," "Jack" concludes, "takes him into many gardens where motor cultivators are used and appreciated. The owners of the machines would not—nay, could not—do without them." Clearly, then, "Jack" does not speak from personal experience. It is "up to" the owners of the "machines" to homologate "Jack's" *obiter dicta*. Mefears he has an axe to grind —or, perhaps, I ought to say, a motor cultivator to sell! And I, wishing him every success, take my leave of him and of the question.

A SCOTTISH GARDENER.

Celery Leaf Miner

This pest is proving rather destructive this year. In view of the dry weather, which makes the growth of a moisture-loving crop such as Celery so difficult, it is incumbent upon all gardeners to do everything in their power to minimise embarrassment. So far as the Celery Leaf Miner is concerned, this can be done by removing infected leaves while the attack is in its infancy and dusting the plants with soot when they are moist with dew. The process should be repeated every fortnight until the third week in September, when one may reasonably expect that the attentions of the Celery Leaf Miner will have ceased. It is important that the soot should be weathered before it is used for this purpose. Almost every gardener has a soot-box somewhere about his premises, and he should draw soot from it which has been stored there for at least three months. New soot contains rather violent sulphur compounds which are liable to injure tender foliage. The Celery Leaf Miner, it should be stated, is the larva of a fly which is very prettily marked. The female lays her eggs on the under-surfaces of the leaves and makes them adhere thereto by using a sticky fluid. In a few days the larvæ hatch out and proceed to make twisted, rusty passages in the leaves. Obviously by taking away some of the assimilating tissue of the plant they do it great injury. Soot, having a pungent smell, makes the surroundings of Celery so offensive to the fly that she avoids them.

Double-flowered Hollyhocks, edged with Hydrangea paniculata, in Greenwich Park

Kalmia latifolia as seen from the pergola

Kalmia latifolia

SPACE, a few yards wide, between a ady pergola and a Yew hedge is given Kalmias. A deep peat bed was pre- for them, and they are near a hidden ipe, from which they are given a cs watering in dry weather. A well- bush of Kalmia is a thing of singu- vell-dressed appearance, with its neat rong-looking foliage and lovely pink Not only is it a thing of fine effect garden, but the individual flower is the most interesting to examine closely. hole cluster of bloom and bud is of a and beautiful pink, rosiest in the bud A single flower is a little upstanding inted cup with a slender white central Ten stamens rise from around its nd arch over, their anthers fitting into hollows coloured a deep red. These ns are sensitive, and, if touched, even he finest needle, they fly back to the , shooting off their pollen as they go. ng at the underside of the bloom, the s where the anthers rested show as ing knobs. In the centre of the flower, the stamens rise, is a little ring of zig- ints of rosy-red, each point directed to the stamens rested. A wonderful to examine closely.

G. J.

Dry weather plants

has been a trying time in the flower up to the present, July 20th, especially facilities for watering are not avail- although a good, deep tilth and fairly g soil has enabled us to pull through than I expected, and it certainly rs a good opportunity of noting plants that stand the drought. This is alike interesting and instructive, and a guide to future planting. Big clumps of Rockets came through well, the flower heads lasting well, and the freshness of the foliage well retained. Young spring plants are now flowering well. The Anchusas are very beautiful, and a welcome dry-weather plant is the rosy Yarrow that supplies a colour not commonly found in hardy flowers. Heucheras have done well, and so has the Daisy-like Erigeron. I always think the petals of this flower surrounding the yellow disc very beautiful alike in texture and colour. Cornflowers, both annual and perennial, have been quite at their best, but this is not surprising so far as the herbaceous kinds are concerned when one considers that their native habitat is not far removed from "The Death Valley." Antirrhinums are among the best of dry weather plants, and those that came through the winter safely are now big clumps and flowering splendidly. With a little care and attention and the prompt removal of seed spikes, they will last well through the season. A few clumps of hardy Fuchsias, too, that are well-established show no signs of flagging, and I have been alike pleased and somewhat surprised at the blue and white seedling Larkspurs making a brave show. The things that have suffered most with me are Phloxes, Scarlet Lychnis, and Rudbeckias, and when replanting these another autumn I shall mix a small proportion of dry cow manure, well shredded up, with the natural soil (this being somewhat harsh and stony). If this mixture gets one thorough soaking the moisture will be well retained, and these plants will hardly be affected so much by a similar spell of drought as that we have experienced this year. Sweet Peas are in grand form just at present, but they, like the culinary sorts, are in fairly deep trenches and well mulched.

E. B.

Wahlenbergias or Alpine Hairbells

These, belonging to the family of Campanulas, are comparatively little known, but the flowers, mostly upright and cup-shaped, deserve a place in the garden of all who make rock plants their special hobby. They are best served when they can be given a place high up on a rockery, where good drainage is assured, with the exception of one variety. They thrive in a compost made up of loam, leaf-mould, and coarse grit or sand. Flowers are purple, blue, and white, and are very freely produced. They bloom for fully three months. W. graminifolius and W. Serpyllifolius are purple, W. saxicola is white. W. hederacea is a creeping sort which likes a cool, shady place, or can be planted among grass. W. dalmatica is a deep purple-blooming sort, very strong, with broad leaves.

Wahlenbergias can be raised from seeds, which should be sown as soon as ripe. If left on the plant plenty of seedlings will, in all probability, spring up. Division of roots in early spring is another method of propagating these showy blooming plants.

WOODBASTWICK.

Azaleas and Rhododendrons

Besides adding considerably to the tidiness of the shrubbery, it also greatly benefits the bushes to have all seed pods removed. In doing this, a little care is necessary so as not to damage the points of the shoots.

REMINDERS FOR THE WEEK

Southern and Midland

Gloxinias

These are approaching their finest flowering stage, and in order to maintain the blooms in a fresh condition over as long a period as possible a slightly drier and cooler atmosphere should be given; free ventilation without cold draughts is desirable, and syringing between the pots once each day should suffice. Too dry an atmosphere will invite the dreaded mite.

Arum Lilies

Where these were left in pots and allowed to ripen their foliage, it will now be advisable to turn them out, clean and shake out the roots, and repot into fresh compost, which should consist of the following: Three parts turfy loam, broken up to about the size of hens' eggs, and one part made up of well-weathered cow manure, or spent mushroom bed, to which has been added a sprinkling of bone-meal. After potting, the plants should be stood on a cool bed of ashes and on the cool side of a wall or fence, and if these can be accommodated with a frame over which the sashes may be placed during excessive rains, it will be an advantage. Those planted out in trenches are growing freely, and must be provided with ample moisture.

Mignonette for winter flowering

Seeds should now be sown to furnish flowers during winter. Pots of 5 inches or 6 inches in diameter are desirable for this purpose. These should be well drained and filled to within 1 inch of the top, with a compost consisting of fibrous loam which has not been broken too fine, spent mushroom bed, or leaf mould, and a little mortar rubble which has been passed through a half-inch sieve. A quarter-of-an-inch of fine soil over the surface will be sufficient for the seeds to rest upon, with a final light covering. Water with a fine-rosed can, and stand the pots in a cold frame, shading them from bright sunshine until germination has taken place, when both light and air must be freely admitted. Thin out the plants to 6 inches or 8 inches in each pot, when large enough to handle, and grow on either in a cool frame or greenhouse, keeping them close up to the glass.

Lilium longiflorum, Nerine Bowdeni, Iris reticulata and its variety Krelagei

Obtain and pot up a few of each of these at the earliest opportunity, and start them in a cool frame. Also lose no time in forwarding the order for bulbs intended for forcing.

Freesias

The bulbs of these may now be shaken out and graded, repotting only the very best into 5-inch or 6-inch pots, from nine to 12 bulbs to a 6-inch pot will be found sufficient. A fairly light but rich soil is desirable, and after potting stand the plants in a cold frame, or they may, with equal satisfaction, be plunged in a bed of coal ashes.

New Strawberry beds

Use the ground recently cleared of early Potatoes for the new Strawberry plantation. This should be deeply dug and enriched with good farmyard manure, as it will have to remain for at least three years undisturbed, and if attended to now will have time to settle down before being required for the early batch of plants. Continue to put down more layers as these become available, and attend regularly to the watering of those intended for fruiting in pots which were layered earlier.

The flower garden

It should be scarcely necessary to remind readers of the necessity of removing dead flowers from the great variety of plants now in bloom; not only is this essential to the beauty of the garden, but it is vital to some plants, which often produce such quantities of seed as to ultimately cause their death. Therefore, where the seed is not required, it should be at once removed.

Hoeing and cleaning, staking and training

All of which are necessary daily, must be kept well in hand if the various subjects are to give of their best, and if a mulch of some kind can be applied to climbing plants growing at the foot of hot walls and fences, the latter will derive immense benefit therefrom. Do not tie in a lot more growths of Rambler Roses than are required to take the place of older growths next year, but select the desired number and remove the remainder as they appear, for crowding is fatal to all.

Ornamental Vines and other climbers

Do not at any time tie these in stiffly, as to do so is to lose much of their charm and graceful form. Vines, Escallonias, Honeysuckles, Clematis, and Cotoneasters are beautiful in appearance when permitted to hang loosely from their supports and often wreathed in bloom.

Hoeing

Keep the hoe constantly on the go among kitchen garden crops, and thus prevent evaporation of the soil. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Celery

Dryness at the roots is always fatal with this plant, so under no conditions must it be allowed to suffer in this way. Should there be any sign of want of vigour, a thorough soaking of liquid manure will help greatly to put matters right. It is a good plan to begin the earthing-up process now, a few inches of fine soil worked in around the plants, besides beginning the blanching process, helps wonderfully to retain moisture at the roots. A little more can be added every few weeks as growth advances.

Earthing-up Brassicas

In exposed situations much damage is caused to Brussels Sprouts, Savoys, and late Cauliflowers by the wind, so it pays in the end to draw a quantity of soil up round the stems of these so as to steady the plants. Do this earthing-up while the soil is moist and before the plants get too big.

Vegetables for spring planting

In the later districts it will be advisable, where this method is favoured, to sow seeds of Brussels Sprouts, Cabbage, Cauliflower, Savoy, and Curled Greens within the next week or so, these to stand in the seed-beds until spring. Cauliflowers, of course, must be pricked into a bed of light soil, under a cold frame in September, for the winter. The seeds of all the kinds should be scattered broadcast and lightly covered with fine soil. Best results are had if the ground is rather poor.

Ply the hoe frequently

The Dutch hoe, when frequently and vigorously plied between growing crops, not only keeps weeds down and the garden trim and neat, but its action permits of the passing of warmth and air to the roots, chec due evaporation, and thus helps to keep healthy and sturdy.

Sowing Onions

In the later districts, if not yet d would now be advisable to have thi sown. The position should be ope sunny and the soil not too rich. Cra Excelsior succeeds quite well when now, while Trebons and Danver's are also excellent and hardy and usuall a good account of themselves.

Planting Strawberries

If good, strong "runners" are av within the next three weeks, there no doubt that autumn planting is best unfortunately, in many districts it i into September before they are fit, a plant at that late date is very risky. such conditions it is well to lif "runners" and lay them in close to in nursery rows for the winter. If pl is to be carried out shortly, the ground be well manured and double dug as so possible, so that it may be well settled by the time the plants are set out.

Fruit picking

This necessary but tedious job dema lot of time, which is lost for other work things are apt to get a little out of ha other departments. Growth is just height, and grass and weeds move alo an alarming rate. Ground under fruit is specially apt to get unsightly, an weeds soon seed, and so lay up more tr for future years. It is well, therefore, all possible, to have the fruit quarters free of seeding weeds, even if it is nece to hand-pick them.

Recently-planted shrubs

With the light rainfall of the cu season, shrubs planted during last s have had a rather trying time of it watering and mulching have been attended to. Even yet, an occasional soa at the roots will be greatly relished b bushes, and if this be followed by a gen mulch of rotten manure or half-rotted le the roots will soon respond.

Pansies and Violas

So that the flowering season may be longed, an occasional overhaul of the p should be carried out. Any old strag growths should be cut back and all pods removed, while an occasional soa of weak liquid manure will help mate to maintain the vigour of the plants.

Tomatoes

Systematic feeding must be given this so as to get the best out of the plants. messy than liquid manure, and much e to apply, are some of the standard arti fertilisers. I find Thomson's particu suited to the wants of this fruit, slight d ings every three or four weeks being best way to use it. It acts well when into a liquid, but this method is some wasteful as all the constituents are quickly soluble in water.

The Vineries

Grapes approaching the ripening should be given abundance of air, eve night, for this fruit resents being coddle close, stuffy houses, flavour and appear being inferior under such conditions, vermin flourish, and later cause no en trouble. Do not permit overcrowding o foliage, but remove sub-laterals w necessary. C. BLA

Ten Days in Levantina

The diary of a visit to the Alps of Val Ticino and around Piora

By HERBERT COWLEY, Editor of GARDENING ILLUSTRATED

JUNE 28TH.

Victoria on 11.20 a.m. boat-train Peter R. Barr and C. W. Needham, ng not a little concerned about my ons' heavy baggage. They travel like —a strange contrast to myself with ak, Alpine boots, and ice axe. Per- y I take no more than I can carry in r for a mile.

B. produced a diary of a trip he Piora 20 years ago. I found this teresting and resolved to make one lf, but am doubtful if I shall keep

ain and boat Needham, who by the s nephew of Samuel Barlow of Tulip ntertained us with stories of old s Tulips, show Auriculas, and laced ius and Pinks; his reminiscences, ay of the Lancashire weavers and their florists' flowers, would make good I hope also that he will give us the f that favourite old Daffodil Horse- ised by a Lancashire weaver.

e near Dover purple and bright blue ffects of our native Viper's Bugloss vulgare) growing in large masses halk. Incidentally, this good plant nied us by rail and road for much journey through France and in and. Another beautiful roadside ommon on the Continent, especially places, is the Meadow Sage (Salvia s). In England it is very rare as a out it is a good garden plant, able to take care of itself in the drier parts of the wild garden or rock garden.

My friends, anxious to avoid travelling by night, arranged to stay at a quiet and seclusive hotel in Paris specially recommended by a friend of P. R. B.'s. It was anything but quiet; dancing to raucous jazz continued till daybreak. In future I shall travel by night.

SATURDAY, JUNE 29TH.

Left hotel at 6.45 a.m. after hardly a wink of sleep. Train to Basle and Lucern, *en route* for Airolo. Near the railway peasants are very busy haymaking—a late and rather poor crop, for the drought has been serious and widespread. Cherry picking is in progress, especially around Lake Lucern, and the crop appears to be a good one. Certainly the cherries we get on the train—white, red, and black—are all that could be desired of these luscious fruits.

We enjoy the glorious run by rail round Lake Lucern, passing Brunnen and Flüelen. The mountain scenery gets finer as we approach the St. Gotthard, ever-changing vistas of mountain, lake, gorge, and torrent amid smiling valleys and snow-clad peaks.

After Altdorf the railway ascends by curves and spirals through scenery of great beauty till Goschenen, at an altitude of 3,640 feet, is reached. This is the beginning of the St. Gotthard Tunnel, which is 9½ miles long.

Happily the trains are electric, and we pass through the tunnel in comfort, emerging at Airolo, 3,750 feet on the southern side of St. Gotthard. Here we alight, after holding up the train while we push all our baggage through the carriage window to be piled up on the platform. The train proceeds on its southern course to Faido, the health resort of the Levantina Valley, and Bellinzona, the capital of the Canton of Ticino.

We stay night at Hotel Lombardi quite near the station.

Enjoy good trout for dinner and fine old Capri wine.

SUNDAY, JUNE 30TH.

Rise early and take solitary morning stroll N.W. of Airolo.

A stormy morning, but am rewarded with good form of Lilium Martagon just at its best, flowering well above a mass of Phyteuma, with elongated heads of blue-purple flowers mingled with Hieracium aurantiacum, Geranium pratense, Salvia pratensis, and the dark Mullein Verbascum nigrum. Although it is Sunday, haymaking is in progress. Unfortunately, the Lilies, both Martagon and croceum, are brought down with the scythe.

Heard cuckoo in the higher valley (it was heard almost daily till July 10th, higher still, around Lake Ritom).

After breakfast we all three search for the Lady's Slipper along the south bank of Ticino. We found only one small plant that may have been Cypripedium Calceolus; it was not in flower.

On our way we encountered scrubby bushes of the Common Barberry (Berberis vulgaris), while rocks were clothed with Dryas octopetala, now out of flower, but showy with its feathery awns, Gypsophila repens, Campanula pulla, Dianthus carthusiorum, and Dianthus sylvestris, all flowering. In moister places were Pyrola rotundifolia and Solomon's Seal.

Airolo from the direction of St. Gotthard on a stormy morning

In afternoon, with baggage, we take the funicular railway from Piotta to Piora, passing Sanitorio and Altanca on the heavenward journey.

This railway is very steep, the steepest I have seen. It was new to P. R. B., having been constructed since his previous visit. It is driven by electricity derived from water power, of which there is an abundance in this part of Switzerland. The power station utilising the water from Lake Ritom is at the foot of the railway at Piotta.

(*To be continued.*)

Geraniums for Christmas

Opportunity should be taken now of potting on any spring-struck Zonal Pelargoniums into 5-inch pots with a view to Christmas flowering in the greenhouse. A compost of old loam, rotted manure, or bonemeal, with a little leaf-mould and sharp silver sand suits them. Potting should be done rather firmly and the plants stood out of doors on an ash-covered walk for the rest of the summer. September will bring well-developed plants ready to burst into bloom a few weeks later, provided in the meantime all flower-buds have been kept picked off. One may have the glowing colours of Zonals in the depth of winter in a greenhouse where the temperature ranges about 55 degs., but it is only by preparing plants beforehand that success may be expected. Plants that have been allowed to bloom in the summer cannot be expected to continue to do so, no matter how much heat one can give them. For small greenhouses a dozen or two plants will bring much gayness, and if some of the semi-doubles are grown, like F. V. Raspail (crimson), Pasteur (rose), and Louis (purple), there will be no dearth of rich colour in the depth of winter.

MIDLANDER.

Garden Sundries

A DIP into the old volumes of GARDENING ILLUSTRATED and recollections of a visit to Sundries Avenue at Chelsea suggest that the inventor and the chemist are busier than ever in the service of horticulture. In fact, of the making of gardening accessories there would seem to be no end. Father Time and changing fashion have found out many of the "wonders" of the past, naturally; they have had their vogue, and passed on to the limbo that is unhonoured and unsung except in the affectionate recollection of ancient gardeners addicted more to reminiscence and rheumatism than to active gardening practice as we know it to-day.

It is evident from the Editor's postbag, however, that there is a widespread lack of knowledge about the "sundries" side of gardening—what equipment to use in certain emergencies, what remedies to apply in others, and where these are to be obtained. Some good purpose may be served, therefore, if in the next few issues we examine what the leading sundriesmen are doing for the gardening community. We shall not be able to mention all the excellent things that lighten garden labour and make for efficiency generally—that would be an endless task beyond the scope of this series. Rather shall we have to confine ourselves in the main to requisites having special merits which are not so widely recognised as they should be, judging from the large number of inquiries that are sent to us every week. It will be enough to say of such productions as the greenhouses of Boulton and Paul, Foster and Pearson, Messenger and Co., and Duncan Tucker, the greenhouse boilers of Kinnell, and the greenhouse paints of Carson—names well known to our readers 50 years ago—
that their steady increase in popula

cal spray, which is certain to have a good reception among those who know the significance of the XL All label.

Corry and Co. is another firm with a big list of aids to gardening and to which, with commendable enterprise, it is continually adding. A lime sulphur wash is often recommended in these pages as a safe summer and winter wash for mildew, Black Spot, Rust, Plum Aphis, and Woolly Aphis. Corry's lime sulphur wash has been in use for over 40 years. Users have also found it an effective control of Big Bud.

" White Fly Death " will completely fumigate an airtight house in 12 hours. It is non-poisonous and, with 2½ fluid ozs. to each 1,000 cubic feet, evenly sprinkled, is a safe operation, obviating any need of " drying off " the house. A non-poisonous " Ant and Woodlice Death " is also effective upon earwigs, slugs, snails, and similar pests. This is sprinkled in small quantities in nests, holes, or runs. A teaspoonful will destroy an average-sized ants' nest. Thousands of woodlice have been destroyed by lifting old bricks or lumber and promptly sprinkling the liquid among the pests, which are killed instantly by its fumes.

" Weed Death " is non-poisonous, non-caustic, and odourless, and dissolves readily in cold water.

" Summer Cloud " greenhouse shading in green and white, " Tenax " grafting wax for grafting and budding, " Safe and Sure " wasp destroyer, tar oil winter wash, " Lethorion " nicotine cone fumigators, Standen's manure, Fowler's lawn sand, and many other allied preparations are distributed by the firm among sundriesmen everywhere. Two items also worth mention are their " Tidy " refuse burner, a perforated, strong, steel-plated cylinder type on tripod, fitted with poker and holes for raking out, and the Evenspread Sprinkler, a perforated container supplied in three grades for sprinkling sand, powders, seed, fertiliser, fine soil, and similar materials.

(To be continued.)

To make a greenhouse wall attractive

Why should the back wall of lean-to greenhouses not present an attractive appearance when there are so many suitable creeping and climbing plants that will transform them? The transformation may be quickly brought about by utilising Clematises. The ideal variety for permanent indoor culture, and one which does best planted out within the house is Indivisa lobata, having white flowers, but use can be made of some of the large flowering lanuginosa section with very handsome blossoms, such, for instance, as Fairy Queen (pale flesh), Beauty of Worcester (bluish-violet, white stamens), or Lanuginosa (pale lavender). It is often more convenient to plant these Clematises in large pots or tubs so that when occasion arises they can be taken out-of-doors. Time was when most greenhouse owners boasted one or two specimens of that most excellent Rose Marechal Niel, which in the spring brought many blossoms of a yellow that has scarcely been surpassed in modern Roses. These can always be procured in pots, and like the lanuginosa Clematis are not dependent on the house being heated. I have a Plumbago (the pale blue capensis) that makes a good coverer for a back wall. Its flowers are produced in the greatest profusion in early summer. Among Tropæolums of the fibrous-rooted kinds there are some which yield many bright flowers in the early year and clamber over a lattice erected on a greenhouse wall.
Mention can be made of Tricoloru
flowers of scarlet and orange and
black. For covering large space
Solanum jasminoides, with bunches
blossoms, and some of the Passiflor
numerous quaint looking blossoms th
fail to excite admiration. You can
green-covered wall by planting one
Asparagus or the trailing Smilax. T
in fact, no dearth in the selection of
plants to cover an inside wall. Th
can be undertaken now.

nual show of this Society was held
16th in connection with the fort-
meeting of the R.H.S. in the New
estminster. It was quite obvious
long drought had materially inter-
th the prospects of growers; it was
teworthy that so many really good
were exhibited.

lasses open to allcomers were not
cept the class for new exhibition
The amateurs in all the prevailing
ances did really well. There was
entry in the class for three distinct
of Viola. This won first prize for
I. Little, Romford, who had an in-
series. He also won first prize for
stinct varieties of Violettes, not less
blooms of each variety, showing
ioletta and Lyric. There were four
or six vases exhibition Violas, six
of each variety. Mr. Mitchener,
was first, showing Walter Kaye,
hnson, Andrew Jameson, Jack Mil-
seley Ideal, and Malcolm Milner.
Luckin, East Grinstead, was a good
showing well Mrs. Jacob Bell,
Hood, and Mrs. A. Stevenson. Mr.
le, Ponders End, was third. A
lass, but for three vases only, found
ur entrants. Mr. Mitchener was
rst with good blooms of John Adam-
alter Kaye, and Moseley Ideal.
prize was awarded to Mr. R. W.
Alton, Hants; and third prize went
Noble. The class for 12 blooms
n Violas in four distinct varieties,
ooms of each sort, found Mr. Mit-
gain leading the van. He had good
of Jack Milner, Rowan Hood, W.
d Moseley Ideal. Mr. Luckin was
cond, having beautiful examples of
Ritchie and Rowan Hood. Mr.
as third. The six competitors for
, white self exhibition Viola, found
H. Little first with large, clean
of Helen W. Cochrane, and with
owers of the same variety Mr.
er and Mr. Luckin were second and
pectively. The class for one vase
eam or cream ground, edged or
Viola, was a good competition. Mr.
er was placed first, with good ex-
of Mrs. H. J. Milner, Mr. Luckin
ith Mrs. J. Ritchie, and Mr. H. R.
entwood, third, also showing Mrs.
lner. A similar class, but for a yellow ground, edged Viola, was also noteworthy. Mr. Luckin was a grand first with beautiful blooms of Moseley Ideal. This exhibit gained the Society's Medal for the best pan of Violas in the show. Mr. Mitchener was second with Rowan Hood, and Mr. Spicer third with Moseley Ideal. For a vase of six blooms of a dark self exhibition Viola Mr. Luckin was again first with a good exhibit of Kathleen Coudry, and with the same variety Mr. Spicer and Mr. Mitchener were second and third respectively.

From Gardening Illustrated

Fifty Years Ago

Flowers for the children

FOR the sake of children have plenty of flowers around your homes. Plant enough so that it may be no sin for the little ones to gather large handfuls and make playfellows of them. One little girl, not four years old then, used to ask me for Pansies before she was dressed in the morning, every day for weeks, last summer. She could hardly count the fingers on one hand, but I used to let her run out before breakfast and gather three or four Pansies. Several times again throughout the day she could have as many more, and they all personated characters to her imagination. Other flowers figured also in these plays, but I do not wonder that the smiling Pansy-faces were most attractive. Children should have their own flower-beds as early as possible, and many half-waste places might be made to blossom like the Rose for their sakes, with but little labour.

Fruit as a medicine

A paper written by P. Holloway was read at a meeting of the Lucas County (Ohio) Horticultural Society, in which he spoke strongly in favour of the beneficial effects on the health of eating Blackberries. He had cured himself of dyspepsia by living upon a small quantity of bread and butter, accompanied by Strawberries, Raspberries, Blackberries, and Peaches, in their respective seasons. The President thought Blackberries the most wholesome of all fruits.—July 26th, 1879.

Leeds Flower Show

Leeds Flower Show, which opened in Roundhay Park on the 16th inst., was a great success. There were 157 exhibitors from all parts of Great Britain, and amongst these the trade was well represented.

The official opening was performed by the Lord Mayor of Leeds (Alderman D. B. Foster) and the Lady Mayoress, who presented the Trophies. The President, Sir John Barran, congratulated the Horticultural Society on the high standard of the show.

Following are the trade awards: —

Rock gardens.—1, P. Gardner, Addingham; 2, A. Greenwood and Co., Wetherby; 3, F. Rowley, Alwoodley.

Hardy cut flowers.—1, G. Longster and Sons, Ltd., Malton; 2, Harkness and Sons, Leeming Bar; 3, G. Gibson and Co., Leeming Bar.

Carnations.—C. Engelmann, Ltd., Saffron Walden.

Miscellaneous plants.—T. M. Petch, Bradford.

Plants and bloom display.—1, Dickson, Brown, and Tate, Manchester; 2, W. Kershaw, Saltaire; 3, T. M. Petch.

Violas.—1, E. Clegg, Dewsbury; 2, F. J. Bell, Whitley Bay; 3, J. Wynn, Selby.

Local nurserymen's display.—1, Greenhill Gardens, Armley; 2, T. M. Petch; 3, H. Clark and Son, Rodley.

Collection of Roses.—1, Wheatcroft Bros., Gedling; 2, R. Harkness and Co., Hitchen; 3, C. Gregory, Chilwell.

Roses (class 2).—1, R. V. Rodger, Pickering; 2, G. Burch, Peterborough; 3, H. Drew, Longworth.

Sweet Peas.—1, E. Leigh and Son, Stoke-on-Trent; 2, Whitaker and Wilson, Collingham Bridge; 3, T. Wadsworth and Son, Bishop Wilton.

Open classes, 24 Roses.—1, R. Harkness and Co.; 2, F. Cant, Colchester; 3, W. Drew, Ledbury.

Twelve Roses.—1, Donard Nursery, Newcastle, Co. Down; 2, W. Drew; 3, F. Cant.

Fourteen Roses.—1, Wheatcroft Bros.; 2, R. V. Rodger; 3, Donard Nursery Co.

Three baskets.—1, Wheatcroft Bros.; 2, R. V. Rodger; 3, H. Drew.

One basket.—1, Wheatcroft Bros.; 2, G. Burch; 3, H. Drew.

"The Yorkshire Evening Post" Trophy

for best display was won by Greenhill Gardens, Armley. The display consisted of a blue carpet of Hydrangeas with huge stands of magnificent Carnations rising at the back and a cloud of Madonna Lilies in the centre.

The Brotherton Trophy for Roses was won by Wheatcroft Bros.

The Clay Cup

Before the introduction of Rose indica, in the last years of the eighteenth century, the majority of garden Roses were hybrids or varieties of the Centifolia-Gallica-Damascena group, and they possessed, almost without exception, that typical fragrance that we now call the "old Rose scent." But when the "Tea-scented China Rose" was introduced in the early part of the nineteenth century and used extensively for hybridisation, a new scent came into the Rose garden which replaced the old scent in some Roses and modified it in many others; and then, about 20 years ago, a new strain of yellow Roses was launched by M. Pernet-Ducher, which gave us many new shades of colour, but seems incapable of carrying the old Rose scent. So that, partly by force of numbers, the typical Rose scent has tended to become obscured by scentless or differently scented varieties among the new Roses.

It was in order to encourage the restoration of the typical Rose scent among the new Roses that the late Mr. Clay presented the cup which is awarded every year by the Royal Horticultural Society. In order to be eligible for the award the Rose, according to the conditions laid down by the Society, must be of good form and colour, it must not be in commerce before the current year, and it must possess the "true old Rose scent," such as may be found in the Provence Rose, General Jacqueminot, General McArthur, etc. This last condition does not seem to have been appreciated by some of the competitors for the award last week, for several Roses were entered which, although they were deliciously fragrant, presented a scent of the Tea Rose type, and this is specifically ineligible. This condition may seem a trifle stringent, and it might be objected that the Tea scent, since it has been present in Roses for about a hundred years, might be fairly called an old Rose scent. But the terms of definition of the "old Rose scent" are fairly wide, and even within the Centifolia group it varies from the deep, rather "grapy" scent of the dark red Gallicas to the softer sweetness of the Provence; and it may be assumed that any Rose would be eligible for the award if the "typical Rose" element predominated in its scent, and that a faint shading with other scents, such as a trace of honey, lemon, or peach, would be allowed.

The Cup was awarded this year to a Rose entered by Messrs. B. R. Cant under the name Aroma; a very presentable Rose in deep carmine, with a full, rich scent of the Gallica type, luscious, but not heavy, in its faint suggestion of the smell of a bunch of Muscat Grapes, which seems to lurk in the depths of this type of scent. The name is not particularly well chosen, for the word "aroma" carries with it an idea of spiciness, when it has been blighted by its horrid use as a genteel word.

impatient of detail, and short of
. speaks of this long life in general
ntury.

dainty are the Tree Ferns from West
ia, their stems covered with Moss, and the beauty of this Fernery is enhanced by the rich green Corsican Chickweed that drapes the stones.

The magnificent Victoria regina is the pride of the gardens. It has eight large tray-like leaves with handsome red, deeply-veined under parts, and these are capable of bearing considerable weight. The great creamy yellow buds that turn to deep crimson when full blown, appear in late summer.

A Cat's Tail, with hanging red flowers, a fine sugar cane, and a deep rose double Lotus, are among other botanical treasures here. Very attractive is the Sensitive Plant, with pinky flowers and delicate foliage that folds up at the slightest touch. Elephant's Ears, a velvety green pot plant, contrasts well with the lighter foliaged plants.

A fine Banana is noticeable for the perfection of its foliage compared with the wind-torn leaves of those grown out-of-doors. In this favoured situation it has produced bunches of 85 Bananas of full flavour and ripeness.

Green manuring

The problem of manure, and especially of the provision of humus in the soil, becomes more acute each year. The practice of green manuring is not so popular as it should be, for here we have an easy way out of a real difficulty. Green manuring means the sowing of a crop which is intended to be dug into the soil before it becomes mature. Lucerne is a good crop to sow for this purpose, and the sowing should be done as soon as possible. (This year Peas have been a failure in many gardens. It would be a good plan to dig in what haulm there is instead of throwing it on the rubbish heap.)

Lucerne and all members of the leguminous family enrich the soil by providing it with beneficial bacteria which live on the roots and give up nitrogen. The supply of humus is satisfactory, and the soil benefits in two ways. The crop is dug in when approaching the flowering stage—it must not be allowed to seed.

C. H.

A trial of Canterbury Bells

The following awards have been made to the under-mentioned flowers by the Council of the Royal Horticultural Society after trial at Wisley.

AWARD OF MERIT.—Single white, sent by Messrs. Dobbie, Edinburgh; Calycanthema white, sent by Messrs. Webb, Wordsley; single mauve, sent by Messrs. Hurst, Kelvedon; Calycanthema mauve, sent by Messrs. Hurst, Kelvedon; double rose-carmine, sent by Messrs. Haage and Schmidt, Germany.

HIGHLY COMMENDED.—Single rose, sent by Messrs. Webb, Wordsley; Calycanthema rose, sent by Messrs. W. H. Simpson, Birmingham, and Webb, Wordsley; single mauve, sent by Messrs. Daniels, Norwich; double cœrulea, sent by Messrs. Haage and Schmidt, Germany.

Answers to Queries

Queries—Queries and answers are inserted in GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FRUIT

Shoot of a Pear tree affected with fungus

(Stellawood).—This is caused by the fungus Podosphæra leucotricha, and is the same as that showing on the young shoots. The best remedy is to cut away all affected shoots and burn them, and spray the trees with Bordeaux Mixture. Le Lectier is very subject to this when growing in the open upon badly drained soil, but is scarcely troubled with it on warm walls. It is also very shy in setting its fruit, even when other Pears are growing on each side of it, but the fruits when well grown and matured are equal to a Comice.

Melons decaying

(Surreyite).—This is a bad case of Melon Spot Mould or Blotch, the cause of which it is difficult to determine. It first made its appearance among Melons in 1896. Destroy the whole lot at once, and before using the house again, have all glass and woodwork thoroughly cleansed with disinfectant. Spraying with Bordeaux Mixture has been tried, but is not very effective. There is no cure for this dreadful scourge so far as we know, and we advise you to burn every leaf and fruit and start again with fresh seed from another source.

Bush fruits

(Castle).—Gooseberries and Red Currants require no treatment after fruiting further than keeping the ground clear of weeds until the leaves drop, when pruning should be carried out. Black Currants can have some of the older wood cut back to near the ground, and thus permit of the current season's growths obtaining light and air, which will help considerably to ripen the wood and ensure a good crop next year.

Grape Mrs. Prince

(W. P. C. L.).—The berries have not been properly fertilised when in bloom, this being of quite common occurrence. You are making a mistake in allowing your young Vine to carry so many bunches this season. Unless the Vine is very strong it should have had all fruit removed as soon as the bunches appeared. A very strong plant might be allowed to carry two bunches the first year. The over-cropping is, of course, part reason at least for the faulty fertilisation.

Pear leaves eaten

(Miss M. N. Warren).—This is the work of the Pear-tree Sawfly (Selandria atra). The sawfly lays its eggs just under the upper surface of the leaves of the Cherry and Pear in June, occasionally earlier. The slugworms, which are covered with a greenish secretion, when about six weeks old, cast their green or blackish-looking coats and appear as buff caterpillars free from slime, being smooth and transversely wrinkled. These caterpillars go down into the ground, spin a cocoon, and from these the sawflies emerge in the following summer. The larvæ feed on the upper surface of the leaves, which in some instances they remove entirely, leaving Pear and Cherry leaves as skeletons. Remedy: Dust the slugworms over with quick lime or gas lime. The first application they will throw off by exuding a coating of slime, but they cannot continue doing this, and if a second application is made soon after the first it will kill them. Vaporite forked into the surface will also account for this pest.

Leaves of Cordon Apples eaten

(Regular Subscriber).—This is the work of the caterpillar of the Winter Moth, which is the most injurious of the leaf caterpillars. If you band the stems of your trees in autumn with the well-known "Stictite" you will have done much to prevent a recurrence of your present trouble, as this will prevent the female from crawling up the stems to deposit her eggs in the spurs and branches. Next year immediately the flowers have fallen, spray with "Katakilla" once or twice and you will have the trouble under control. This pest attacks some varieties more than others, especially Codlin Apples, but was not responsible for the tree not fruiting, its energies being directed towards the foliage only, a bad case leaving a tree entirely defoliated.

Red and White Currants in collection of fruit

(Robin).—Red and White Currants are distinct varieties and may be shown as such. Black and White Grapes are, for exhibition, allowed as distinct kinds of fruit, and, therefore, Black and White Currants, see Rule 2 of R.H.S. "Rules for Judging," page 9. Should the Schedule read: "So many distinct kinds of fruit," then every dish must be of a different species of genus, and one dish of Currants only will be allowed.

FLOWER GARDEN

Salpiglossis and Larkspurs failing

(H. G. Fulford).—Too much water in their infancy will bring about the trouble your plants are suffering from, and this has probably been the cause of yours. Also, if kept too wet when first planted out on cold aspects, the same will occur. There is nothing you can do at the present time except to keep them somewhat drier until growth is strong and free, but before planting out next season, and before digging the ground intended for them, apply a dressing of freshly slaked lime, and a few weeks before actual planting takes place fork in a little Vaporite over the surface.

Plants for a crazy pavement

(J. E. T. C.).—Acænas in variety, Draba aizoides, Pratia repens, Stachys corsica, Thymus serphyllum coccinium and album, T. lanuginosum, Silene acaulis, Raoulia australis, Trifolium repens purpureum, Veronica pectinata and prostrata, Dianthus cæsius and D. deltoides, Erinus alpinus, Helxine Solieri, Mentha Requieri, Nierembergia rivularis, Campanula pulla, C. pusilla, C. rotundifolia, Hypericum repens, H. reptans, Sideritis taurica, Omphalodes verna, Sedum acre, S. hispanicum, S. Lydium, S. murale, Saxifraga apiculata, S. Aizoon, S. muscoides, S. Rhei, Sancta, and u

The value of "SANITAS Powder"

is proved by experience

" (exact copy). Hucknall, Notts.
8-5-29.

Sirs,

About four years ago I had a circular left here referring to your "SANITAS POWDER" as a good thing to use in the Garden, and so thought to give it a trial as we were pestered with sparrows and insects, eating and destroying the peas and small seeds. As an experiment I tried the various rows with it, and alternately without it, and I felt I must write you (after three successive years trial) to say, it is the best thing I have come across, and can assure you I would not be without it. I have recommended it to every garden holder I know ; and I may say I live in the midst of hundreds of allotments, and after trial I have been thanked over again, many times, some stating it has been worth its weight in gold, a statement (from personal use) I can endorse, I use it on nearly every seed and plant, roses included. Results always satisfactory You can refer anyone to me and I can assure you, they will be advised by me to try it, and they, if local, can see the results in my garden.

Yours, in grateful remembrance of circular,
(sd) S.T.A. "

trees with a weak solution of copper sulphate, keep them well supplied with water, damping them overhead in the evening after hot, dry days; an improvement should then be seen. When watering the plants it is necessary to soak them thoroughly, surface sprinklings being useless.

Dorothy Perkins

(" Boone ").—Your Rose is rather weakly in growth, and would probably benefit considerably by having a good watering at the roots, followed next day with a generous soaking of liquid manure. In late autumn as much of the old wood as can be spared should be cut away near the ground and young shoots trained in in its stead.

TREES AND SHRUBS

Cutting Spiræas

(W. S. C.).—Without knowing the variety or varieties of Spiræa you wish to cut back, it is impossible to advise as to the best time to have this done, some kinds being best pruned in March, while June is the proper time for others. The same with other flowering shrubs.

Flowering shrubs for a public garden under trees

(T. E. Lloyd).—It will be of little use trying to grow anything beneath such voracious feeding trees as Limes and Elms, but there are many lovely subjects which could be grown at a respectable distance from the base of such trees. Would it not be possible to remove a few of the large trees in order to admit of more light and sun and enable you to grass down much of the space now covered with objectionable Privet? If this could be done, then you could plant bulbs such as Crocus, Snowdrops, Scillas, and Daffodils for spring effects. The following shrubs would also prove much more interesting and beautiful for grouping in the more open positions: Azalea mollis in variety, A. occidentalis, Rhododendrons in variety, with Lilies of the auratum and speciosum type among them, Grislinia littoralis, a fine evergreen which, however, does not bloom, Ribes alpinum, Berberis aquifolium and B. japonicum, B. Darwini, Garrya elliptica, Berberis aristata, and B. umbellata, Gaultheria Shallon, Vinca major and V. minor, Hypericum moserianum, H. calycinum, Ivy (large-leaved kinds), Arbutus Unedo, Skimmia japonica fragrans, S. Fortunei, Vaccinium vitis-idea, Bambusa, such as aurea, nitida, nigra, fastuosum, etc., Escallonia langleyensis, E. macrantha, Choisya ternata, Cornus alba, Red Dutch Honeysuckle, Eleagnus in variety, Symphoricarpus occidentalis, Coronilla emerus, Hydrangeas in variety, Cotoneasters in variety, Jasminum nudiflorum, Leycesteria formosa, Olearia Haastii, Rubus spectabilis, R. irenæus, R. bambusarum, Osmanthus illicifolia, Spiræa arguta, Veronica Traversi, Viburnum tomentosum and V. plicatum, and, of course, there are many plants which might be used.

VEGETABLES

Tomatoes and fowl manure

(" Tomato, Thanet ").—It looks as if your soil had become " Tomato sick," while the use of the fowl manure is by no means reliable for this crop unless used with great judgment, as it is difficult to exactly gauge the proper amount to apply. Also we do not favour mulching with stable manure. While little can be done to improve matters this season, for next year the soil should be wheeled out to a depth of at least a foot and fresh, sweet loam brought in in its place. This could be carried out after the Chrysanthemums are over.

MISCELLANEOUS

Insect for identification

(C. H. A. R., West Hagley).—The insect sent for name is the Giant Wood Wasp, Sirese gigas. The female wood wasp lays her eggs in various kinds of Pines. The long appendage at the end of the abdomen is the ovipositor, by means of which the lady bores a hole in the bark of the tree selected, and deposits her eggs. When the eggs hatch, the maggots begin to feed in the timber, making long tunnels. When fully fed, the larvæ make their way towards the outside of the attacked trees and pupate in a position so that when they emerge as perfect insects they have not far to eat their way out. The jaws of both larvæ and adult are very powerful. A case is on record where this creature was present in a piece of worked wood fixed in a house, with a lead gas pipe attached. On eating its way out, the adult came in contact with the pipe, and instead of turning aside to find a softer place ate right through the pipe and was killed by the escaping gas. Attention was called to the damaged pipe by the smell of gas, and the creature was found dead in the hole it had made. Death was surely a poor reward for its enterprise! Sirese gigas is frequently imported into this country by means of pit-props and similar timber, and it no doubt breeds in this country, but extensive damage to home-grown timber is not recorded.

Sand for potting

(H. S. G.).—There is no process by which fine sand can be turned into proper material for use in gardening operations. Sea sand, if sharp and clean, is probably the best for general use among potting soils. It must, however, be well washed before being used, or else it should be kept in the open for at least 12 months before being brought into use so that the rain and air may remove the salt present in this material.

Bullock's blood

(Mrs. E. Labouchere).—We do not recommend this smelly, unpleasant material for use in a vinery, or, indeed, anywhere where people have to be about. It has, of course, a certain value as a manure, but is less objectionable if dried and used as a powder. It is then applied at the rate of about three-quarters of an ounce per square yard and hoed in.

SHORT REPLY

"*Castle.*"—Iris sibirica can quite easily be divided, February or March being the best time to carry out this operation.

NAMES OF PLANTS

Z. P., Surrey.—The Rose had all fallen to pieces when it reached us, but is, probably, Mme. Segon Webber. The Honeysuckle was also much knocked about, but is, probably, Lonicera Webbiana.

J. O.—1, Crassula; 2, Scabiosa caucasica. Cuttings of the Crassula can be secured in August and inserted in small pots of sandy compost, and kept rather close and shaded. Pot off singly into small pots as soon as rooted. Give very little water during winter. Give a shift in early spring, and after the plants are well established, say, early in July, plunge the pots in a bed of sand close to the foot of a sunny wall. Little or no water should be given, and the plants, before the advent of frost, should be taken to a cool pit, but at no time should frost be allowed to reach them. Water very sparingly during the winter.

A. P., Devon.—1, Eleocarpus reticulatus; 2, Kalosanthes coccinea; 3, Escallonia Donard Seedling; 4, Amorpha fruticosa.

E. F., Hereford.—1, Viola Bluestone; 2,
badly withered, but probably Viola
Black; 3, Viola gracilis Purple F
Euphorbia cyparissius, not rare.

Alec Short.—1, Campanula mu
Sedum album; 3, S. spurium splen
Viola cornuta purpurea.

Northerner.—1, Lathyrus grandifl
Lonicera italica, a fine hybrid bet
caprifolium and etrusca.

M. N.—1, Centaurea dealbata; 2,
thus alpinus.

" *Quæro.*"—Campanula patula (S
Harebell), the leaves of which are la
the flowers more violet than in C. m

'OXFORD ROADLESS" BARROWS

are ideal for carrying loads over soft and uneven ground which an ordinary wheelbarrow cannot face satisfactorily

he following are extracts from a few of the many appreciative letters received:

"The barrows have been in daily use for the past ve months under all conditions, viz.: over rough, smooth, and oggy ground, and we have pleasure in testifying to their fficiency."

"I have nothing but praise for your Creeper tracks, specially on a three-creeper truck which you made for me a ear ago, and I cannot speak too highly of its work."

"We now have a good many of these barrows in use, nd they are a great saving in labour. We would not be ithout them for anything."

"Nearly twelve months ago we purchased a barrow tted with one of your track wheels. We found this very seful, and far superior to the old style of wheel."

A high-grade production constructed of thoroughly seasoned timber.

"Martsmith" Pneumatic Hand-Sprayer, S. 44. Price 45/-

"Martsmith" Sprayers

are most adaptable to an infinite variety of uses

Possibly the Garden Comes First. "Martsmith" Sprayers embody a fine-diffusion principle that ensures a more penetrating spray than any other. Half the work—half the time.

Then the Wife Saves a Bit! She limewashes her own ceilings—distempers rooms—thus saving on decorators' bills.

Or for Washing the Car! Alter the jet slightly and you get a generous flush of water that sluices the grime off in a jiffy.

The latest "Martsmith" Catalogue is yours for the asking!

Colour Names and Descriptions

By Gertrude Jekyll, V.M.H.

ERE have been lately a number of
tes and articles on the subject of the
scription of colour in flowers. Some
favour of a colour chart, which may
y be of use to those who have but little
le for the perceptions of colour distinc-
But without such a means of refer-
there are quite enough ordinary ex-
; in natural objects and substances and
; with an obviously typical colouring to
s a basis for an accurate description of
lour of a flower. Some colour words
een so long mis-
that they have
into the language
their unblushing
Such a word is
. We read in
lists "brilliant
yellow," mean-
right yellow such
Buttercups. The
of gold is not
t yellow; it is
yellow at all. I
iece of gold on a
path and it just

to gold.
her misused word
e. In plant lists
eant for a bright
scarlet, such as
me bedding
ums, in Nastur-
and in Tropæo-
peciosum, whose
r name is Flame-flower. But the
of flame is not red at all; it is a rather
ite yellow, with occasional flares of a
uish tint. It is the incandescent coals
e red or reddish, but are never of so
a scarlet as Tropæolum speciosum.
not say scarlet at once. There are
degrees of scarlet, some deeper than
we may consider the type, and some
g to orange, but a useful central
of type may be accepted from the
of some well-known objects, such as
al pillar box or a guardsman's tunic.
red is a fine word, and stands for a
colour, such as is well shown in some
Dahlias and Hollyhocks. Magenta is a kind of purplish-red, capable of unpleasant virulence, which is offensive to many a trained colour eye. In view of the fine reds existing, it may safely be excluded from the garden. As the name is derived from a sanguinary battle, it ought to have stood for a good blood-red; it corresponds to some forms of the French *amaranthe*, where in foreign plant lists it serves as a useful warning. In justice to the continental seed and plant lists, it is only right to say that their colour descriptions are generally more careful and accurate than our own. One of the most oddly misused words is amethystine, and it seems to have been accepted even by learned botanists. It is common to find in plant lists such a plant as a Delphinium described as a brilliant amethystine-blue. No amethyst is blue, or anything the least like blue; it is reddish-purple; in all but the best examples a washy reddish-purple. I can only suppose that when the word was first used in connection with the colour of flowers, that the careless giver of the name muddled up amethyst and sapphire, and said amethyst when he meant sapphire, which is a gem of a pure blue colour. It is pleasantly noticeable that in some recent catalogues the word amethyst is properly used. Messrs. Cheal have a Dahlia named Amethyst quite rightly named. They have also a fine deeper purple one named Porthos, not so obviously named for colour unless it is in reference to the "purple" patches in the musketeer's adventurous career!

Munstead Dwarf Lavender

The various names, mauve, lilac, lavender, purple, and violet, are much confused, but are all useful if properly used. Mauve especially is commonly used too loosely; it actually means the rather feeble reddish-purple of the common wild Mallow (*Malva sylvestris*)—mauve in French. Lilac should stand for the same kind of colouring, but deeper, that of the slightly reddish-purple of the old garden Lilac. Lavender speaks for itself, for though there are garden forms of Lavender whose colouring may be a shade lighter or darker, it has always the same quality of colour.

The word blue is grossly misused, commonly serving to cover a number of purple and purplish flowers, such as Campanulas and China Asters, that are not blue at all. The word should be kept for the pure blues, such as the deep colour of Commelina and Salvia patens, of Cornflower and Gentian, the medium blues of Nemophila and Phacelia, and the tenderer blues of Forget-me-not, Agathea cœlestis, Cynoglossum amabile, and Plumbago capensis. There are vague words in common use denoting blue that are difficult to define. I do not know what is meant by azure, except that it is some kind of palish blue; *azurea* in botanical wording seems always to mean a pure blue, but azure is so vaguely used that it is perhaps better excluded from plant lists and left to the poets.

One of the most trustworthy colour words is sulphur, because the substance is so nearly invariable in colour that if a flower is described as sulphur one knows exactly what is meant. Primrose is also useful to denote a shade of pale yellow near sulphur, but a slight shade greener. Salmon is also a good colour word for a whole range of pink or pale rosy shades with a warming yellowish inclination. Orange is a fine colour word, and needs no explanation. Lemon is also a good word, for though it may have shades deeper or lighter, the quality of the colour is invariable. The word citron may be usefully employed for shades of colour lighter and tenderer than lemon; of this class the now popular Grape fruit is a good representative, as its colour varies so little.

Descriptive words for foliage are also plentiful. Grass green usually stands for a full, bright green. Apple green I am never sure of, but think it means the colour of some unripe Apples. Bottle green for the deepest polished foliage describes itself, and so does sage green, a quite useful word. Glaucous is a fine word for the many plants whose foliage is of a grey colour inclining to blue, such as that of the common Pink, Eryngiums, many of the Cabbages, and notably Seakale. Silvery grey is also permissible, for though it is not really like silver it may well stand for the colour of the Artichoke, Stachys lanata, several of the Artemisias, and other plants that make such a beautiful setting to flowers of pink and purple colouring. Thus it appears to an old student of colour that it is pleasanter and quite as effective to describe a flower as, say, primrose yellow than as Pl. XVI., S. 24.

G. Jekyll.

Minister of Agriculture on rural amenities

Mr. Noel Buxton, the Minister of Agriculture, in opening a flower show at Upshire, Waltham Abbey, stated that village flower shows in these days were acquiring added importance.

They were all familiar with the efforts of the National Gardens Guild, of which the Queen was the Patroness, to bring beauty and colour into the towns. There was need for similar encouragement in the country. This was in no sense a case of carrying coals to Newcastle. Our modern activities, motoring and so forth, had planted many hideous features on the countryside. Petrol stations were raising their pale, forbidding heads on red posts, and there were other harsh features along our modern roadways. The Gardens Guild, which was now extending its activities into the country villages, was doing a great service in promoting competitions aiming at beautifying the countryside.

Horticulture had its more material aspect—the growing of fruit and vegetables—and here the Ministry played a notable part in improving the technique of cultivation. He was personally eager to encourage local authorities to provide model allotments and demonstration fruit and vegetable plots. The best could only be obtained if the land were cropped and cultivated according to plan. The Ministry was already helping local Councils with money to provide these demonstration allotments.

The Lea Valley, in which the show was held, contained a most extensive glasshouse industry, the annual value of the output of Tomatoes and Cucumbers alone being over £2,000,000. The Ministry was assisting research in glasshouse problems by a grant of over £3,500 a year to the Cheshunt Research Station.

He was eager also to promote village amenities, and the Ministry, through the Development Fund, made grants for the promotion of village halls. Nothing could be more conducive to happier conditions than a place where villagers and the country people around were tempted to meet. The Rural Industries Bureau, also assisted by Government grants, helped to promote handicrafts,
such as basket-making, and he com
these activities for the improvement o
amenities to the notice of every villag

Correspondence

Garden form

THE suggestion that the collector type of garden owner makes sole possession a test of a good plant is a little unkind. In my modest way I have distributed both to amateurs and the trade large stocks of two very good new garden plants, Chrysanthemum Mawii and Mutisia retusa, and in the same way all my friends, when they get a good thing, are most anxious that everyone should share in their good fortune. To quote only two names, the gardens have been immensely enriched in the last few years by the generosity of Mr. Hay and Mr. Millard. Mutisia retusa this year has passed my fondest expectations. One plant, which has dragged a Cotoneaster down to the ground, is covered at the moment of writing with a hundred large pink flowers 3½ inches across.

Other new plants which have done very well this year are Phlox argilacea, introduced by Mr. Hay from North America, Chrysanthemum hispanicum, introduced by Mr. Lofthouse from the Sierra Nevada, and Arctotis (Dimorphotheca (?)) acaulis, introduced by Professor Watkins from South Africa. A new Phlox, P. mesaleuca, from North America, promises well.

William Lawrence.

Bone meal as a manure

I very heartily commend Mr. Markham's thoughtful note on the use of bone-meal to all gardeners, and especially to the amateur. Its value is known to the majority of us, and it has one quality which Mr. Markham, perhaps, overlooked. The most of what are, colloquially, known as "artificials" are, in careless or in inexperienced hands, liable to do damage as well as to make the soil acid by their continual use; but bone-meal is as nearly "fool-proof" as any manure substitute can be. For lawns it is excellent.

Arctotis (? Dimorphotheca) acaulis, 2 inches to 2½ inches high

Rock gardens at Chelsea

The article by C. Penrose, on pag
in the issue of this Journal for July
really calls for an answer, and though
are many more qualified than I to m
yet my pen cannot rest but leaps to th

I find it difficult to discern the vie
of C. Penrose, "S. I. B." (whom
scathingly criticises), and many more
most insular opinions expressed by wo
critics of the Chelsea Rock Gardens
seems to stand on the hilltop of his
opinion—and tastes—and endeavou
shout down some other shouter.

All those who hold impartially alo
do not allow themselves to become
in this ever recurring dispute, must
that it is quite impossible ever to be
matic about the rock garden, and ye
Penrose and his earnest confreres pers
trying. One says: "Nature mus
idealised in the rock garden." A
says: "Nature must be faithfully cop
the rock garden."

I do not intend to hold forth at
about my own opinions on the su
though I have strong ones. That
defeat my own ends. I will only say
my rock garden endeavours to be a repr
tion of the true lines of Nature, whils
providing suitable homes for plants, a
attainable object, in spite of all that is
to the contrary.

One would almost imagine, after re
the many one-sided articles that hav
cently appeared, that one must either
an inartistic jumble of stones, though
viding homes for plants, or a structu
coldly imposing grandeur like Col.
Jones' admittedly wonderful reprodu
but offering no nooks, pockets, or scree
the plant lover to revel in filling.

I contend that the true rock gardener
of necessity be a plant lover, else why
a rock garden at all? There are few
can afford, or would wish for, a portic
the Welsh granite ranges set down in
gardens merely as an appeal to the æst
senses.

Should we not try to strike the h
medium between reproduction and ada
and endeavour to please all, though I fe
should never satisfy Mr. Penrose,
apparently hungers for extremes.

Some people prefer Chopin to Liszt,
ch was good at his style.

I should not have written so much—my life is too full to admit of continual badinage. Also I am much too busy to ever kick at the R.H.S. And I do not " pat my friends on the back," but when I see a good piece of work I hope I shall always be honest enough to praise it if occasion demands—and irresponsible critics provide plenty of occasion.

Of the two pieces of work disposed of I must say I preferred the " severity " and " imitation " of the one to the flat and rather monotonous prettiness of the other, and, so far as I heard, this was the generally expressed opinion. There was too much stone spread about on the space in the latter case, giving none of those pleasant reliefs to the eye and spirit, but showing from a short distance a bewildering and flattish expanse of rocks. In a garden this effect would have been still more evident after the lapse of a year. J. WOOD.

The colours of flowers

More than one of your correspondents lately have expressed dissatisfaction with the want of precision in defining the colours of flowers and have advocated an authoritative standard for universal use. I am afraid there is no remedy for the prevailing uncertainty, the difficulty of standardising colour being inherent in the nature of the subject, and insuperable. Ruskin expressed indignant dissent on being told that a Crocus was not golden till it appeared above ground; he would have denounced still more strongly the statement that it was not golden until some eye perceived it. Nevertheless, that is the truth.

Colour has no objective existence; it is purely subjective, being a sensation caused by the impact on such fibres of the retina as react to such of the components of pure light as are not absorbed by, but may be reflected from, the object in view. Even if it were assumed that the sensation caused by any ray in the spectrum is exactly the same in every individual, that sensation is subject to infinite modification by other rays reflected from adjoining objects. Thus the sensation of red is strengthened by proximity of its complementary green, that of blue by its complementary yellow. We commonly speak of Geranium ibericum as a blue Geranium, and if a spray of its blossom is placed, say, among the flowers of a yellow Tulip, it will cause the sensation of strong blue; but set it among bright green foliage and the complementary red ray will assert itself, causing the Geranium to appear purple.

Dyes may be chemically manufactured to reflect any colour with precision, but the fabrics to which they are applied must always have their effect modified or enhanced alongside of fabrics reflecting other colours.

Monreith. HERBERT MAXWELL.

Colour charted and catalogued

The letter of Mr. Percy E. Chappell in your issue of July 13th, stating his approval of the Fellowes Colour Chart, is most interesting.

As the author, I write to say that this chart, which is entitled " Colour: Charted and Catalogued " (publishers, Geographia, Ltd., 55, Fleet Street), was compiled for the use of inexpert persons unaccustomed to describe subtle differences of hue. This chart forms a basis on which they can discuss and select hues on equal terms with an expert. Unlike most colour charts, the hues do not depend merely on a colour name. Each hue has been fixed by definite colour measurements, with which the user is not concerned. It has besides a specific number and a simple colour name.

The 400 hues cover the whole field of colour in a simple sequence of bright, dull, strong, and weak hues, a key reference, and pigmental colour, as described in the subtitle. E. FELLOWES.

Oriental Poppies in the flower border

Your correspondent, " F. H.," writes in your issue for July 20th about patches of Oriental Poppy that are so handsome in the flower border in early summer, but that leave such unsightly blanks when their bloom is over. The same problem presented itself here (south-west Surrey), and was got over in this way. A slightly raised mound of rather large size was planted for a good display of these Poppies. They are in groups, the centre of each group about 6 feet apart. Each group, when in flower, occupies a space about 4 feet across. Between each we planted Gypsophila paniculata. This was two years ago, and now each plant of Gypsophila is a cloudy mass of bloom also a good 4 feet across, completely hiding the cut-down Poppies. But when the Poppies make their first growth again in the late summer we cut away some branches of the Gypsophila to give them room. Behind all this we have some plants of the hybrid Clematis Jouiniana. It occurred here, as it has done in other places, where its obvious parents, C. Vitalba and C. Davidiana, are grown. This makes yearly flowering shoots a good 15 feet long and is trained over the now discolouring Gypsophila, and over any places where a gap asks to be filled. I do not think that this particular plant is procurable, but a fair substitute would be Clematis Flammula.

G. J.

Ostrowskia magnifica

I SEND you a photograph just taken of a remarkably fine Ostrowskia magnifica that I venture to think is worthy of your notice. It is growing in a corner of my rock garden here. Height of plant, 7 feet 4 inches; width of individual bloom, 6⅝ inches; five bloom spikes, with a total of 17 blooms open and nine to open. THOS. KINGSCOTE.

Watermoor House, Cirencester.

Ostrowskia magnifica well grown in a Cirencester garden

A proposed Rock Garden Society

I should like to say how much the idea of a Rock Garden Society appeals to those who are interested in growing really rare and difficult Alpines. To the ordinary person the difficulty of getting in touch with really keen amateurs is great. We all know dozens of people who talk about their rock gardens, but when we go and see them they are usually collections of one or two hundred most ordinary plants. What makes an interesting Alpine garden is not its size, but the planning and showing off real treasures to the best advantage, and I personally think Sir W. Lawrence's suggestion a most excellent one. N. S. C.

Godstone.

Meconopsis Baileyi

In reference to "J. R. K.'s" note on the hardiness of this subject (page 494), I can assure him that many plants, both old and young, and quite unprotected, came through last winter here without the slightest injury. The thermometer registered zero on two occasions, and for five days it did not rise above 12 degs. A box of seedlings on a garden path was frozen solid for a fortnight, thawed, and again frozen for a similar period, yet they all appeared in spring and are now lusty plants. I agree with Mr. Puddle that M. Baileyi is unquestionably hardy. A. T. J.

Carnarvonshire.

—— I think "J. R. K." is decidedly too sweeping in his wholesale condemnation of those whose idea of a blue flower does not agree with his. He quite forgets the enormous influence soil has on colour. I had a Pentstemon procurus some time ago, the most vivid clear blue. I grew a cutting of it and brought it to a different soil and situation. It is now a most uninteresting mauvy dull blue, and unless I myself had taken
those cuttings I should not have beli
to be the same. Look how vividly b

If it were possible

It has often been remarked that in
summer the gardener who has work
valiantly through the spring seeks o
shady tree, either literally or figura
and allows time to go unheeded. V
excuses are made for this inactivity, b
anyone ever offered the reaction fro
plethora of flower shows as an excus
later idleness? Surely after the fren
management which is required on th
of the committees, one might reasonab
pect the harried members to want both
and repose, qualities of good garde
which do not often have a chance i
exhibition rooms. But whatever e
may be offered, surely all must be cons
valid, when the terrific heat and blazing
light fill the midsummer world and
exacting physical labour seem far from
desires.

But whatever excuse one must off
midsummer idleness, however flimsy it
appear in the cold light of necessity,
gardener should practise it in the gar
the extent of meditating on the present
of his accomplishment. To sit quietly,
in the drowsy heat of a July afternoon
let the mind and eye play quietly ov
garden scene, filling up the spaces that
yet to be filled, observing critically the
development of the garden picture, an
ciding as carefully as possible wheth
not the slowly forming garden pictu
fashioning itself to your heart's desi
far from sloth.

The above are the sentiments of an
can writer in the National Hortic
Magazine for July. Many an English
dener who is a member of one or
show committees will heartily agree and
wish that it might be possible to sit
a tree and meditate. He will, however

Hoeing

never one reads the advice published h the gardening and in some of the and weekly papers, and the particular t is that of the value of "hoeing," arly always sees the words "keep the hoe going." The purpose of this is to spread the fame of a hoe I have using for some months, and which is the Sproughton. There is no possible rison between the two. The ghton, with its double cutting edges s free point, together with the angle ich the blade is set to the handle, does hing the Dutch hoe can do and much in half the time and without fatigue

do many people neglect hoeing? The r is that it is too fatiguing. So it is any type of hoe except the one I am mending. A dry time such as we have aving needs the hoe more than any- Let anyone who has not already so try the Sproughton, and if he does gree with me I shall be very surprised. presented several to friends and they what a splendid tool it is.

B. STANLEY.

Loganberries

McGuffog's note (page 512) relates an ence which exactly coincides with mine On my return after some weeks' un- ible absence during the hard frost one first things I noticed was that the of the Loganberries were, to all ap- nces, completely dead, nothing but a ticks remaining to indicate where had hriving and hefty canes. I gave them an utter loss, but decided to leave them, n with many other things in similar l, to see if they would start again later. pleased to say that they are now as ishing as ever, and only the other day I ed quite a number of fruits well ad- d on this new growth.

ing the last eight years here I have, on ccasions, suffered considerable loss of and even the complete destruction of lants during hard winters, so I was not altogether surprised at the damage this time.

I note that Mr. McGuffog has been more fortunate and has never known Loganberries to be killed back before. With us here it is, as is seen from what I say above, not an uncommon experience, and I should say, from my experience, that in this district they are one of the most likely fruits to suffer in severe winters. Incidentally this, alongside Mr. McGuffog's experience, goes further towards proving my contention that the climate here is more trying than that of Scotland, and that it does not follow, as many Scottish gardeners seem to think, that everything which is hardy in Scotland is so here by any means. J. R. K.

Skipton, Yorks.

The hardiest Helianthemums

A border of mixed Helianthemums, planted haphazard, has for many years been a cheerful feature in my garden, but the past winter has cleared out half of them.

From our misfortunes we can often draw some useful information, and a list of the hardier varieties is my solace in this case.

Here they are: Sudbury Gem, Smith's Pink, Miss Lake, Mrs. Croft, and Bonfire.

These are not merely survivors, but varieties which have come through unhurt, foliage covering the whole plant.

In another place I note The Bride and Scarlet Queen as untouched by frost.

A large pink-flowered seedling given me by Mr. Musgrave seems to be quite hardy.

Can any of your readers extend this list?

Among the killed are Album plenum, Aureum plenum, and A. Fireball.

E. A. BUNYARD.

Paul's Scarlet Climber

ONE catalogue describes this Rose as only of moderate growth, and the Rev. J. H. Pemberton is reported to have said that the only fault he had to find with it was its name—that it never grew higher than 12 feet with him and should be called a Pillar Rose.

I enclose a photograph of one I planted five or six years ago. It is now 27 feet high, and, as you see, has a mass of glorious flowers. It has never had any manure whatever, which, I consider, accounts for its vigour and for the cleanness of its foliage. The white Rose which has grown into it is one of Pemberton's Musks.

The other photograph shows a bit of the Rose garden. In the foreground is a bed of Wilhelm Kordes; Ophelia and Mme. Butterfly are in the next bed and Betty Hulton in the third. On the right, under the wall, are Mme. Butterfly and Betty Uprichard. The soil is chalk, which I dug out to the depth of 2½ feet and replaced with good loam. That is all that is done, excepting spraying for mildew in autumn and Black Spot in winter. No manure is given, but the Sproughton hoe is used freely. Immediately after pruning I give all my Roses a dressing of burnt vegetable matter. HERBERT NASH.

Chantry Dene, Guildford.

Left: A Rose garden on chalk *Right:* Paul's Scarlet Climber 27 feet high

The Alpine Sea Holly (Eryngium alpinum)

Eryngiums

THE steely-blue colouring of the stems, spiny leaves, and flower-heads of these hardy herbaceous perennials, popularly known as the Sea Hollies, renders them valuable border plants for decoration during the autumn months, and if carefully dried the inflorescences make useful ornamental material when flowers are scarce in the winter season.

Deep-rooting perennials, they succeed in a medium, well-worked loam, and although they sometimes take two years to become thoroughly established they then make fine clumps which remain satisfactory for a number of years without disturbance, and are very effective in borders on account of their unique habit and colour. They should be given an open, sunny position to ensure the rigid development of their stout stems on which the Teasel-like flower-heads are borne. They resent disturbance and should not be moved too frequently. When this becomes necessary propagation can be effected by division, but they can be readily raised from seed.

E. Oliverianum, one of the best of the genus, is a strong growing plant about three feet high with large, rather elongated flower-heads of a lustrous, metallic blue. E. amethystinum is a somewhat lesser plant with attractive, deep-blue stems and flower-heads.

E. planum is a more slender but taller growing plant with a distinct branching habit and bears flower heads of a pale blue colour in profusion. E. giganteum is a very strong growing plant with silvery-grey foliage and pale blue heads of flowers. E. Zabelli is a splendid decorative variety of a deep blue colour and without spines. E. Bourgati, with small, deep blue flower-heads, and E. maritimum, with paler blue heads, are dwarfer growing kinds and excellent for the front of the hardy flower border. W. AUTON.

Woking.

Verbena species C.E. 354

The plant which was exhibited as Verbena species C.E. 354 at the Royal Horticultural Society's fortnightly meeting on July 16th, and received an Award of Merit subject to its being named, has now been identified as Verbena corymbosa (Ruiz and Pavon).

Perpetual Carnations and the Holidays

TO many people the only regret at the holidays is leaving one's plants. The head gardener or the amateur all have the same sensation when they depute the care of them to someone else. So much depends on the deputy.

The head gardener who has a "second" or boy should be able to hope for the best from one of his own training, but the amateur who has to rely on a friend naturally has some anxieties, for he knows how quickly his plants dry out in hot weather. To such people it is a good plan to plunge one's plants outside in soil up to the rims, in a shady position. Plunged thus deeply in the soil they require less water and do not dry out so quickly. This is especially important for the young plants recently put into their flowering-pots, as if these become abnormally dry they are apt to go hard.

I should not be misunderstood to mean that a shady position outside is good for a permanent position, but merely as a temporary place while the owner is away from home. The anxious owner of his plants may in such circumstances rest comfortably assured that his beloved plants will thrive with less than half the attention which would be needed in the greenhouse, for Mother Earth has a cooling effect and moisture-giving ability, when the plants are plunged up to the rims, which is remarkable. This applies not only to Carnations, but to many other plants of our favourites. A top dressing of fertiliser or liquid manure helps them meantime.

On the return from one's holidays one should replace Carnations in the houses, for, while bearing in mind that during summer it is necessary to keep them soft and growing freely, as the summer nears its end we should steady the tendency for softness and prepare to ripen them in autumn. Thus, while it is good to feed regularly now and to continue to do so until September, at that time the plants should only be given half quantity, and feeding ceases at the end of the month or early October.

For the same reasons one puts Carnations under glass at the end of the summer, as in the case of continual or heavy rains at this (or any) season plants become too soft for winter blooming under glass.

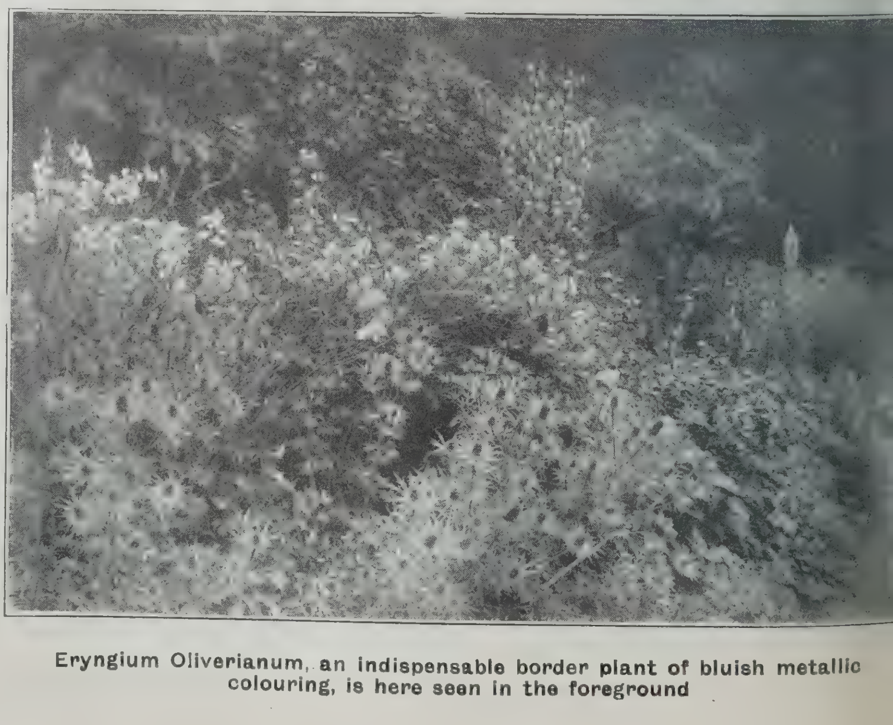
During the hot spells which have prevailed this summer, one notices a big differ the behaviour of varieties. Our old fav Enchantress and Baroness de Brienen, like it, while some almost like it. variety Saffron, which is not one of t to open in the sunless days of winte well, and the salmon-pink Eileen Low, geny from Baroness de Brienen, se revel in the heat and keeps well withou "curly."

It is quite an important point in a tion that it should behave well and la during these hot spells. Among which I have noted good for this bein Silk (the pretty art red fancy), Crystal Orange Sunstar, Sunstar, Sheila (orange, flaked red), Lady Northcliff Laddie (both rather tall growers f amateur), Brilliant (deep scarlet), Top Mrs. Cobb (crimsons), Spectrum and Nicholson (scarlets), Thomas Ives (Mrs. Ward Improved and Master M Stoop (rose-pinks), Daphne and Amos (mauve-heliotropes).

A good result of this ample sunlight return of fragrance which in winter d missing, or not to be noticed in so varieties, and the sun brings out a good point in the Perpetual Carnatio it demonstrates that there are few f which last as well cut during the Thousands of dozens are sent from C Garden Market to far away provincial t where the florists rely on them as som which will not let them down during t hot spells. LAURENCE J. C

Delphinium Hunsdon Del

Of the many Delphiniums shown this one novelty, Hunsdon Dell, seems to out from the rest by virtue of its pur wonderful colour. The flowers are clear Italian sky-blue, it is semi-doub free and vigorous growth, and robust stitution. This handsome variety receive First Class Certificate of the British phinium Society when shown by M Bones, Cheshunt, Hertfordshire. Fron point of view of border effect we can con of nothing finer than the tall blue spir Hunsdon Dell.



Eryngium Oliverianum, an indispensable border plant of bluish metallic colouring, is here seen in the foreground

St. Bruno's Lily or Paradise Lily (Anthericum Liliastrum) glorifies the alpine meadows around Piora

Ten Days in Leventina

The diary of a visit to the Alps of Val Ticino and around Piora

By HERBERT COWLEY, Editor of GARDENING ILLUSTRATED

(*Continued from page 516*)

JUNE 30TH.

IVED at Piora in afternoon in dense . The hotel is situated on the edge a lake of which we see very little. mp and cold in this summer resort, ing no fires, though we should have ld of one.

JULY 1ST.

Awakened in the chilly morn to of bells, a herd of black goats being p to browse all day on mountain The mists have cleared, revealing the of mountains around the lake.

Piora is beautifully situated—it lone at the head of Lake Ritom, ng no village. It is reached only by —no motors, no horses; one donkey is it a mule?—brings up the

ld up here. We are among the first The hotel is almost empty. This is a good centre for the plant-lover. orning mists had disappeared the ped heights of Taneda, Corandoni, oughe look most inviting. We are me good days among the higher nd are excited at the prospects of the heights.

Needham has a tendency to vertigo, finds the altitude too much for him. es wisely to descend to Airolo, and 3." goes with him.

scend by zig-zag track to Sanitorio, in advance.

This track is most interesting for its wild flowers. Some of the slopes literally white with Paradise Lily—Paradisia (Anthericum) Liliastrum—now in full bloom.

Lago Ritom and cascade seen from the dining-room at Hotel Piora

There are large colonies of Globularia in rocky places, and the bright orange-yellow Arnica montana gives good splashes of colour.

There are large, almost silvery rosettes of Saxifraga Cotyledon wedged in between rugged granitic rocks.

We pass village of Altanca, a jumble of cabins, cowsheds, and pigsties. Needham facetiously named the village Altanca odorata.

At Sanitorio I leave P. R. B. with Needham and return alone to Piora.

TUESDAY, JULY 2ND.

Alone at Piora on a bright, sunny day.

Left Lago Ritom on the right and ascended by first cascade to Lago Tom.

Primula farinosa abounds in moist places by the lake. It is one of the common flowers here. Interspersed with it are the intense blue flowers of Gentiana bavarica, making a study in pink and blue that could not be bettered. Some higher slopes are bright yellow with flowers of Geum montanum mixed with a little Ranunculus, with Buttercup-like flowers borne close to the ground. The colour of these two flowers is so closely matched that it is not easy to distinguish them.

Proceeding higher, past two small lakes or tarns—I like the word tarn, meaning a tear dropped in the mountains—and crossing a steep patch of snow, where ice axe comes in useful, I reach Lago Scuro. It is covered in snow and frozen over, and almost surrounded by snow. There is a magnificent view across the frozen lake. The shrill call of the marmot is the only sound to break the quietude of these dizzy heights and ice-bound lake.

Scrambling about on rugged granitic rocks between drifts of snow I espy bright little

Eritrichium nanum in its native home. It is difficult to reach and almost impossible to cultivate

This beautiful and interesting little plant grows on these precipitous rocks. Two plants in flower are clearly seen in the closer vie of the centre illustration

patches of pure sky-blue. Yes, on closer inspection it is the far-famed Eritrichium nanum in full bloom. From a little distance the flowers look like a clear blue film on the rocks. The little Forget-me-not-like flowers must be seen in their native haunts to be fully appreciated. The plants, clothed with fine, silky hairs, hug close to the cliffs, and the blue flowers sit tight upon their cushion of leaves. Verily, this treasure is well named Roi des Alpes.

Near by are other treasures of the high Alps, Androsace carnea, Ranunculus glacialis, and Soldanella pusilla.

(*To be continued.*)

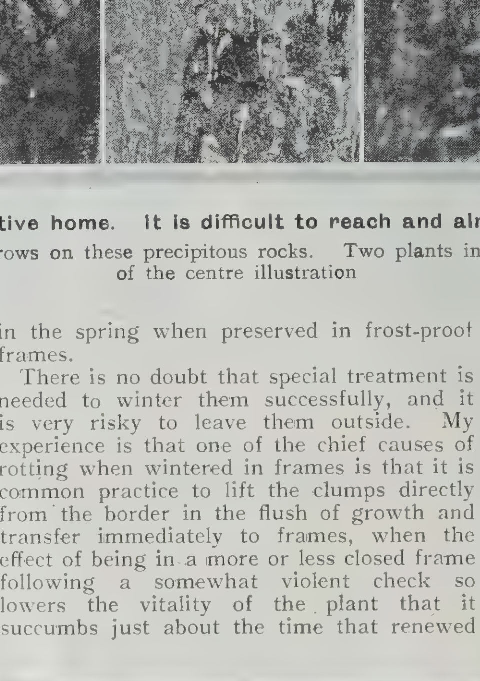
Lobelia cardinalis

IN recent years many good, tall, herbaceous Lobelias have been introduced with distinct colours in various shades of pink, violet, purple, and scarlet, but a good type of crimson is more to be desired than any other colour in this section, and none can surpass L. cardinalis for sheer dazzling beauty. The present season, difficult as it has been for many plants, has only served to intensify the beauty of the foliage and the brilliance of the flower of this handsome subject. A lover of both heat and moisture, it may have suffered from drought conditions on lighter soils, but in good, strong soil which has had an abundant supply of organic manure incorporated with it so that it retains moisture and the surface mulched with similar material growth and flowering is well-nigh perfection.

Opinions differ as to the methods of cultivation of this plant, and while some assert that it may be left in the border during the winter by giving the crowns some protection, others maintain that it must be lifted and wintered inside. It is admitted that the plant presents some difficulties in wintering, but it is not wholly a matter of temperature, for while it will survive the winter unscathed under certain conditions, it is by no means unusual to find whole clumps rotted in the spring when preserved in frost-proof frames.

There is no doubt that special treatment is needed to winter them successfully, and it is very risky to leave them outside. My experience is that one of the chief causes of rotting when wintered in frames is that it is common practice to lift the clumps directly from the border in the flush of growth and transfer immediately to frames, when the effect of being in a more or less closed frame following a somewhat violent check so lowers the vitality of the plant that it succumbs just about the time that renewed growth should take place. It is a caution to prepare the clumps for few weeks beforehand by slightly them with a fork a few weeks before actually removed. A semi-ripening of the crowns then sets in, and much better able to resist winter co It is also advisable to divide the cro encourage new growth early in the as it is often when left too long wit tention that heavy losses ensue. Ev piece grows freely if given good c in fairly strong heat in the spring, the plants are well established they transferred to cool conditions, harde planted out, as, when well harden will even stand considerable frost stage.

It is quite easy to raise stocks f sown in strong heat in spring and off so soon as the seedlings can be but the resulting plants will not b form depth of colour, and further tion should only be effected from plants. W.



Lago Scuro, about 9,000 feet, frozen over and covered in snow

From a photograph taken on July 2nd

Epigæa repens (Mayflow

Belonging to the Natural Order Epigæa repens is a small evergreen only a few inches high. It is American plant, where it is found i positions in the shade of Pines. specific name implies, it is of a trail of growth with cordate-ovate enti the nerves of which are very hairy pretty rose-tinted flowers in small which exhale a rich, spicy fragran pear in spring. As previously s natural home is under trees, theref advisable to plant it in the shade of shrubs. E. repens is a charming pl shady situation, thriving in sandy soil. It may be increased by div well-established plants. The plant known under the common names of Laurel and Mayflower.

REMINDERS FOR THE WEEK

Southern and Midland

Peaches in the open

As the varieties begin to colour freely, discontinue syringing and also manure water, and apply clear water only until the fruits are gathered. Tie in all loose growth and push back leaves wherever there is a tendency for such to obscure light and sun from the fruits. It is also advisable to examine all ripening fruits daily, removing only those which fall freely into the hand. Wasps and bluebottles are often troublesome, and if this becomes serious the fruits must either be placed in light muslin bags or gathered a little in advance of actual ripening, finishing them in a cool room. This, however, should only be resorted to when serious trouble exists, as nothing is comparable to the fruit freshly gathered from the tree.

Vineries

Do not omit to apply abundant moisture and generous syringings to houses from which the fruit has been cleared, and leave the ventilators open fully both day and night from this date in order that both wood and leaves may become thoroughly hardened. Feed with one of the excellent Vine manures now available those later houses carrying heavy crops, and close the houses daily at an hour which admits of the foliage becoming dry before night.

Plants intended for winter blooming

Whether Zonals or other Pelargoniums, Poinsettias, Coleus thyrsoides, Begonias, Primulas, or other subjects required for this purpose, all should be potted on as soon as they are ready into their final pots and kept growing freely. A few of the mixed collections of stove plants will also benefit from a further shift into larger pots at this season.

The bulb order

Referred to last week, this should—to avoid disappointment—be sent off without delay for those bulbs which are intended for forcing. Roman Hyacinths and a few of the large-flowered varieties, Narcissus, such as Maximus, Golden Spur, King Alfred, and the merits of the sweet scented varieties should not be lost sight of. Tulips, both early and late flowering, Grape Hyacinths, Chionodoxas, Scillas, and Lachenalias.

Carnations

Those layered in frames, as advised in a former calendar, should now be gradually exposed to light and air until the lights may be removed altogether. If the growth is clean and free, the plants may be freely rosed over with the can in the late afternoon following hot days so long as the soil is kept from becoming sodden. Keep perpetual-flowering varieties growing freely, and syringe the plants in the evening as a check against Red Spider, shifting on into larger pots as desired. Tie in any growths liable to become damaged, and place supports in readiness for advancing shoots.

Celery

This has been severely attacked with the Celery Fly this year, and only by constant spraying with quassia has this disfiguring pest been kept down. The plants are now growing luxuriantly, and must be assisted by frequent waterings and applications of artificial or manure water. Keep a sharp look out for Celery Rust, the most serious trouble which the Celery grower has to deal with, and spray with Anti-Rust immediately its presence is noted, or with Bordeaux Mixture.

Salads

Make sowings of Lettuces in order to provide plants for the filling of cold frames and warm, sheltered borders, where they will winter safely. Also make a sowing of Spinach to stand the winter on a well prepared and well drained border which has been made tolerably firm.

Roses

It has been a wonderful Rose year, and, generally speaking, the plants have kept reasonably clean from the many and various pests which attack them. Train in weekly the fast growing shoots of climbing kinds, remove dead and unsightly flowers every few days, watch for mildew and rust, which is almost certain to put in an appearance within the next few days, and spray immediately with Mildew Specific and Anti-Rust.

Pansies

Make a sowing of a few good varieties for planting out in late autumn to form broad edgings to beds of spring and other flowers, and keep the seeds removed from those now in bloom in order that the full plant's energy may be given to the development of successional bloom.

Lavender

Cut the blossoms as they become fully open and before the lower part of the spikes begin to fall away, and cut when the whole bush is quite dry. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Pot up Freesias

The bulbs should now be shaken out of the old soil and the largest again potted up, the small ones, unless wanted to increase stock, being discarded. The compost should consist of sweet, fibrous loam three parts, leaf-mould two parts, and sufficient clean, coarse sand to ensure free drainage. After potting, set in a cold frame, shade from the sun until growth appears, and do not over-water.

Roman Hyacinths

For early blooming, pot these up as soon as procurable. The compost advised above for Freesias will suit admirably if a small quantity of quite dry cow manure be added. Place six or seven bulbs in a 6-inch pot, or, if wanted for room decoration, three in the 5-inch size make very neat little specimens. If merely wanted for cutting, the bulbs may be planted in boxes.

Repot Cinerarias

These should have a shift into the flowering pot before becoming unduly pot-bound. Clean, well-drained 6-inch pots are very suitable, but for the stronger plants the 7-inch size may be given. Good, sound loam, leaf-mould, and sand, with the addition of a 6-inch potful of bone-meal, and a 4½-inch potful of Thomson's plant manure, to each barrowload of soil will give good results. Set in shady frame on hard ash bottom, water with judgment, and give abundance of air.

Herbaceous Calceolarias

These gorgeous subjects have still many admirers, and a well-grown group is certainly well worth a little trouble to procure. The seedlings growing in boxes should now be fit for transferring to 3-inch pots. Use a sweet compost of good loam, leaf-mould, and sand, and do not press the soil too firmly. Set on ashes in a well-shaded cold frame, keep rather close for a few days, an
with great care.

Increasing Fuchsias

Cuttings of these graceful plants, if
in pots of very sandy compost and
cold frame, will root more readily n
they are likely to do later on. Keep
just nicely moist, not saturated by
quent watering. Set in a cold fra
shade from all sunshine until rooted.

Border Chrysanthemums

The tying of these should have reg
tention so as to prevent damage b
while in the case of varieties that a
grown for the production of large blo
thinning of the shoots and the remo
superfluous buds must be given du
The earlier such operations are carr
the better will be the results.

Pentstemon cuttings

While it is much too early to think
pagating the main batch of these, in t
of rare varieties it is well to now secu
cuttings as are present, and this wi
likely encourage the plants to send o
growths, these being secured later.
all the more necessary in a season l
present one, when growth is slo
stunted by reason of the prolonged dr

Pansies and Violas

These are suffering from the dry co
of the soil, and cuttings are to be a
commodity in many districts. It will
therefore, to secure any that may be a
now, in case the plants die off, as t
threatening to do. Watering and m
(with very old manure or leaf-moul
help to keep them healthy.

Sowing Onions

In the later districts it will be well
now, if this has not already been do
a fortnight later will be more suita
sheltered, early localities. To sow to
usually results in the plants "boltin
spring. Cranston's Excelsior, D
Yellow, and Trebons are all good Onio
succeed well when sown in autumn.

Jerusalem Artichokes

To prevent the stems being knocked
by the autumn gales, it is a good plan
this time to cut them back to about
from the ground. This does the c
harm, if, indeed, it does not add to t
of the tubers.

Harvesting Shallots

Even in late districts this crop shou
be ripe and should, therefore, be gath
once, as the bulbs very quickly begin to
out roots again, especially should a s
wet weather set in. Lay out the
thinly on a hard bottom and in full su
to mature thoroughly before storing
winter.

Parsley for winter

To ensure a steady supply of this
herb throughout the winter and spring
be necessary to employ a frame
most of that period. A bed of nice,
compost should be prepared under
frame, and fresh, healthy seedlings
therein. Make nicely firm, and shad
all sunshine for a few days, but do n
too close or the leaves will turn
After they are growing freely, take
sashes so as to make the plants as
as possible. Only on the advent of kee
should the sashes be placed over the f

Third prize was secured by B. R. Cant and Sons, Ltd., Colchester.

Yucca gloriosa, about 7 feet high, now flowering in the Calverley Grounds at Tunbridge Wells

This imposing Yucca has an immense panicle of large white flowers. It is one of the noblest plants in English gardens

A smaller class for 18 blooms, distinct, was a good feature. The leader in this class was Mr. G. Burch. His better blooms were H. V. Machin, Mrs. F. Dennison, George Dickson, Coronation, Dean Hole, Mrs. C. Lamplough, and Candeur Lyonnaise. Mr. H. Drew, Longworth, Berks., was placed second, and third prize was awarded to R. Harkness and Co., Hitchin.

AMATEUR SECTION.

In the class for one basket of cut Roses, mixed varieties, not more than 18 stems, there were four pretty exhibits. First prize was won by Mr. J. E. Rayer, Worcester, with a light and airy arrangement, second prize by Mr. J. N. Hart, Little Heath, Potter's Bar, and third prize by Mr. G. Marriott, Carlton, Notts.

The chief class for amateurs was for 12 blooms, distinct varieties, open to all amateurs. There were five excellent exhibits, first prize being won by Mr. H. F. Spicer, of Hitchin. His bloom of George Dickson, a beautiful example, gained the Silver-Gilt Medal for the best Rose in the amateur classes. Mr. J. E. Rayer, Worcester, was placed second, and Mr. J. N. Hart third.

Another class for 12 cut Roses, distinct, open to growers of fewer than 500 plants, was represented by three splendid exhibits. First prize was won by Mr. Norman Fletcher, Farringdon, second by Mr. Alan Gibbs, Lisvane, and third by Mr. E. T. Gann, Tankerton, Kent.

There were only two exhibits in the class for six distinct varieties shown in vases, not more than three, nor more than seven, stems of each variety. First prize was well won by Mr. G. Marriott, who had good examples of Golden Emblem, Souv. de G. Pernet, K. of K., Emma Wright, W. F. Dreer, and Los Angeles. Mr. H. F. Spicer, Hitchin, was awarded second prize. D. B. CRANE.

Sundries for the Lawn

Continuing our review of garden sundries commenced in last issue, it will be appropriate to refer this week to a few accessories for the lawn

ALL the arts of the green-keeper and all possible aids to lawn maintenance have been severely tested this season. Mowers have ceased for long spells from mowing, and rollers are at rest as far as most lawns are concerned. Hose and sprinklers have been working overtime until their use in many districts has been proscribed by anxious water authorities. The customary baldness on the base lines of the tennis court has encroached nearer and nearer upon the service lines, and nearer, possibly, is the conversion of many owners to the laying down of the best substitute for grass—a green hard court.

For sprinkling large areas one of the best watering appliances is Pattison's "Majestic" sprinkler. Its two arms are of wide span, and they scatter a fine mist-like spray which does not flood. These makers of the well-known horse boots are specialists in all equipment for the lawn. Their "Sarel" spiked roller for aerating and cultivating fine turf, and their Graduator-distributor for applying top-dressings to links and large lawns, are extensively used. Another good sprinkler of a revolving wheel type, mounted, is the "Pluviette."

The "Atco" lawn edge trimmer is an indispensable machine where an immaculate appearance on the borders of large lawns has to be maintained. Running smoothly along the turf edge, on curve or straight, it works with a continuous shearing action and imparts, to ornamental lawns especially, that finish which is so much coveted by less perfect gardeners. Another useful "Atco" appliance is the Turf-replacing Weeder, by means of which weeds, complete with their roots, are lifted from lawns and clean turf replaced in the cavity by the same ingenious tool, used also for planting bulbs in turf or returfing bare patches.

Leaf sweepers may be expected to come into operation earlier than usual. Ransomes have a very good machine for this. An enclosed canvas collector is driven by side wheels operating a revolving brush which sweeps up the leaves and light refuse in a thoroughly efficient way besides being stimulating to congested turf, to which it imparts a healthy appearance. A device of a simpler kind for the small lawn is the "Springbok" rake. Its hardened and tempered teeth give it an exceptional flexibility. It is light, easy to work, does not clog, catch in the roots, or injure the turf in the slightest. Users are finding it handy also for tidying up paths and courtyards, and preparing seed beds. This rake has quickly become popular and has taken the place of its Bamboo prototype now rarely seen in this country. A rake made on a similar principle and known as the "Brumerake" was introduced to our readers last year.

The latest novelty in weeders is the "Ricco." This is in the form of a dredger 38 inches long which is charged with "Ricco" powder and, when pressed down over the weed, automatically releases sufficient of the weedicide for complete destruction of the weed. The powder is non-poisonous, and by this means is applied to the weed only, leaving the surrounding grass untouched.

The difficulty of transport over lawns is met by the "Oxford Roadless" barrows. These are in various types and sizes, all fitted with the "Orolo" track unit, which not only obviates any risk of marking the surface, but enables barrows, light trucks, and water carriers to be wheeled over dug or cultivated ground, or over obstacles or rough ground en route. The legs of the barrows are fitted with shoes as a further protective measure. Track units can be supplied for existing barrows.

Lawn sweepings and all garden refuse are incinerated and rendered into fine ash for fertilising by the Incinerator Company's "Dragon" series of destructors, supplied in garden, estate, and commercial sizes from 3 feet 6 inches to 9 feet 2 inches in height to top of chimney. These are an improved type made of strong steel plate. The bottom of the chimney projects into the furnace in order to withdraw the products of combustion from newly charged material and thus minimise smoke. A rocking grate is operated with a footstep, and so shakes the ash through to the ashpit with a minimum of trouble.

(*To be continued.*)

From Gardening Illustrated

Fifty Years Ago

Sawdust and slugs

I HAVE found the following plan of getting rid of slugs very efficacious, namely, sprinkling sawdust round the plants as one would quicklime and soot. The latter when once wetted lose their effect, but sawdust retains its virtue, however wet, and, sticking to the slugs, prevents their approach. When dry, slugs detest it.

Rustic picture frames

Pretty frames may be made with Nuts and cones. I lately saw some made of Beech Nut shells, fully open, along with others not so far advanced, Acorns, Hazel Nuts, and numerous small cones of different sorts, the whole forming a pretty and effective frame, which may be either square, oval, circular, or hexagonal. A piece of strong cardboard is brushed over with glue, in which the Nuts are set on a groundwork of dried Lichens. The larger cones are generally placed singly, but the smaller Nuts are mixed and grouped together. When finished, the cones and other parts receive a slight coating of varnish. Where plenty of cones and Nuts can be had, very pleasing combinations might be made in this way.—*August 2nd*, 1879.

Empty spaces

These should all be filled up without delay with Coleworts, Cabbage, Sprouting Broccoli, and Kales, as these will furnish a lot of useful, sweet food during the winter months.

Value of deep cultivatic

The value of deep and thorough cu
in garden practice has been a theme
dening literature for longer than mo
can remember, and if any further

Heating Orchid house

An interesting example of the prac
plication of electric heating comes f
North of England, where a keen
grower of Orchids with large greenh
these and other tropical plants has
had to depend upon hot-water pipes c
to a coke-fired boiler. Constant atte
the boiler was required, particularly
winter, to keep the heat of the Orch
at the necessary figure. Firing late
again early in the morning, as well a
times during the day in this case pro
some, especially as in the other hou
taining semi-tropical plants a lower
ture was sufficient. The obvious
therefore, was to instal separate hea
the Orchid house and make it inde
of the remainder of the buildings.
purpose the Industrial Heating De
of the G.E.C. was consulted, and
heavy waterproof type of tubular he
designed. A number of these hea
experimentally installed in the Orch
to a total length of 82 feet. To pres
proper saturation of the atmosph
heaters themselves are constantly

sign, and accurate temperature contr
Orchid house is effected.

Armeria cæspitosa

This comparatively choice Alpine h
the South of Europe, where it grows
tions of 5,000 feet to 8,000 feet ab
level. It is the smallest of the Th
Sea Pinks, and a most desirable su
the rock garden. The habit is dw
compact, forming dense tufts of dar
leaves, which spring from a br
woody root-stock. Its small heads
coloured flowers are borne on short,
stems, 1 inch to 2 inches high, fr
to September. The plant thrives
drained, rather poor, sandy loam. If
in rich soil it is liable to damp of
collar in wet weather.

Notes from the West

HOUGH some plants are admittedly
er drought resisters than others, it is
to see, when making observations
garden, that plants which are in
ultivated ground are better able to
d drought than those which are in
soils. If there is any truth in the
that we are in for a spell of dry
those who are contemplating the
ut of new flower borders might well
s in mind when preparing the soil.

Kalmia glauca

This little shrub is one of those whose great merits seem to have escaped the notice of the general run of gardeners. A native of N. America, where it ascends to great altitudes in the Rocky Mountains, K. glauca was introduced in 1767. It is an evergreen species making a sheaf of upright, slender, twiggy branches, usually rather less than 2 feet in height. The leaves, which are narrowly oblong, are about 1½ inches long and up to ⅜ inch wide. They are pointed at each end, recurved at the margins, and have their short stalks adpressed to the stem. A rich, lustrous green on their upper sides, these leaves are so glaucous beneath as to be almost white. The flowers, appearing in small terminal clusters in April, are very beautiful. Of the typical Kalmia shape, the five-lobed corolla is about ½ inch across and of a bright, keen rose, the unopened buds being ruby-red. Flowers are yielded in great abundance year after year, and their season often extends well into summer, and, as often as not, there will be a light second crop in autumn. K. glauca is, of course, quite hardy, and it is by no means difficult in sandy peat or any cool, well-drained loam in which ericaceous plants in general prosper. It enjoys fairly moist conditions, especially in spring and early summer. In fact, it may sometimes be seen growing in shallow water at the margins of lakes in the Rockies. Full sun is desirable, but partial shade is not resented should this be deemed advisable on account of too dry a soil. Unlike K. angustifolia, of which there are many forms, this species may always be identified by the characteristics given, especially by those of the foliage, while it flowers very much earlier than any of the others. These blooms, it may be added, are fairly resistant to light frosts. This delightful shrub may be increased by detaching rooted offsets or by cuttings of half-ripened shoots in August.

A. T. J.

FRUIT GARDEN

The Vines need attention

IT is strange that so many gardeners have greenhouses suitable for Vine growing and yet never attempt to provide themselves with their own Grapes. The greenhouse need not necessarily be a large one; in fact, some of the very best fruit has been grown in small greenhouses.

If it is wished to have forced Grapes, the border for the plants should be inside the house. It should be about 3 feet deep and 4 feet wide, and it must always be well drained. Good coarse loam is the soil Vines like best, and wood ashes and lime added to it, with rubble and bricks at the very bottom of the bed to provide drainage. After it has been prepared, the bed should be well watered and then left for a few days. The Vines should be planted in the summer; young plants should not be put in after July. When taking the young plants out of their pots, the matted roots should be shaken out so that they may get a good hold of the new soil freely. A large hole should be made for them, and the roots carefully earthed up bit by bit.

The less vigorous Vines, such as Lady Downe's Seedling and Foster's Seedling, require only about 3 feet between them, but those like Syrian and Gros Guillaume should be given about 4 feet.

Vine plants should be well watered after they have been removed from the pots, and before they have been planted. Throughout the summer the greenhouse should be constantly syringed so that a warm, moist atmosphere may urge on growth, but at the end of summer the actual growth will cease and the wood of the Vine will begin to ripen, so that less heat and moisture is then necessary. Gradually the greenhouse should be made cooler, and free ventilation given night and day.

For young Vines the stem should be cut right back to about 3 inches in December; that is, to within two or three buds of the base, so that it may become a sturdy plant before it bears fruit.

Until April the greenhouse should be kept quite cool, and then the ventilators should be closed until the temperature goes up to, say, about 60 degrees in the day time, when they may be opened; but throughout the growing time the temperature should be kept about 55 degrees to 60 degrees at night. If the greenhouse is well warmed by the sun during the day time it will be found that the night temperature will also be kept up. From April onwards the greenhouse should be kept of a moist atmosphere by constant syringing, and always—winter and summer alike—the roots should be well watered.

Frequently the failure of the Grapes to "set" well is due to the fact that too much moisture is given, with the effect that free fertilisation cannot take place because the pollen is damp and not easily moved. When the young Grapes are nearly as large as Peas a pair of Grape scissors should be used to thin out all superfluous Grapes. It is difficult to say exactly how many should be cut out, but beginning at the bottom and moving up through the bunch, thinning should be continued until the remaining Grapes are about ½ inch apart. Grapes are usually ready for thinning out by the first week in May.

Apples dropping

Some of the earlier dessert Apples have an awkward habit of dropping their fruits before they are ripe. Damage by bruising may be prevented by spreading straw or litter beneath the trees to catch the fallen fruit. Beauty of Bath is one of the worst sinners in this respect. James Grieve also has a bad reputation for being in a hurry to get off the tree.

The other extreme is provided by the delicious D'Arcy Spice, now sometimes known as Baddow Pippin, and one of the finest-flavoured of all Apples. If this is taken from the tree too early it will shrivel to uselessness. Leave it hanging as long as is safe and then store in clean paper in a box. It will also keep well put away in dry sand.

Market growers are now realising the possibilities of cold storage of Apples, and Bramley's Seedling, Newton Wonder, and Blenheim Orange have proved themselves especially adapted to this treatment. C. H.

Strawberries

Layering must now be attended to, especially where quantities are required for forcing. It is difficult to improve upon the usual practice of layering into 3-inch pots, the latter being stood close together between two rows of plants and all suitable layers from the two rows brought into the one row where the pots are placed; thus alternate rows are left clear for watering and other necessary attention. The pots should be filled with rich soil and made tolerably firm before pegging the layer upon them, and examined for water daily, all extension layers being cut away. Do not neglect the old plants at this stage, as a good soaking of water occasionally will prove of great assistance to the development of the layered plants which are feeding upon them.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FLOWER GARDEN

Curious Foxgloves

(Okeford and M. A. Pilkington).—Okeford sends the apex of a Foxglove spike bearing a cup-shaped flower at the top. M. A. Pilkington sends a newscutting which is headed "Drought Makes a Rose Out of a Foxglove," and the cutting includes a reproduction of a photograph showing the so-called "Rose." The newscutting states that the flower came from Devonshire and was sent to a Scientific Society in London. An officer of this Society is reported to have said: "I can only explain a freak such as this by the abnormal weather we have had lately. The long drought must have caused a stoppage of growth in the stalk. At the same time the raw material out of which the flowers are made continued to be forced upwards from the roots. Then came a heavy fall of rain, unsealing the channels which had for so long been closed. The flower material had to be utilised at once, and the way Nature took was to form what would have been many flowers into one large flower. The bell shape entirely vanished, although the markings on the inside of the bells, which show the bees the way to the hidden nectar, occur on the linked petals of the new flower. About 14 different flowers, I reckon, have gone to make the Rose-like blossom. The most curious fact about the matter is that the abnormal growth should have been regular and not confused. I have seen a somewhat similar growth before, but that took place in a Campanula, not in a Foxglove. The cause was the same, drought followed by heavy rain." If the officer in question is reported correctly, which we doubt, he is surely in error as to the cause of this Foxglove producing an abnormal flower at the apex of its spike. If it was a result of the dry season of 1929 why is it that the same thing happened in 1928 and 1927, and regularly each year before that for many more years than we care to remember? At least one seed firm in this country has offered seed of this plant for many years, viz., Messrs. Sutton and Sons, of Reading, and it is probable that many other firms do the same. In the catalogue of the above firm the plant is listed as Digitalis monstrosa, and its description reads: A remarkable Foxglove. Very large, bell-shaped terminal flowers, white and various shades of rose. Perhaps Messrs. Sutton and Sons could inform us as to who introduced D. monstrosa into cultivation, and perhaps something of its history. If this data is available we think that the drought of 1929 will be cleared of the honour of introduction. The drought of 1929 has done many things, but it is surely not guilty of making Roses out of Foxgloves.

A choice selection of perennial plants and annuals for a light and well-drained soil

(Flower-lover).—Perennials: Delphiniums Queen Mary, Harry Smetham, Millicent Blackmore, Starlight, King of Delphiniums, King George, Rev. E. Lascelles, James Kelway, Glory, Pink Beauty, Border Carnations in variety to include Bookham Clove, Bookham Rose, Coral Clove, Bookham Scarlet, Peach Blossom, Princess Mary, Leslie White, and others, Anthemis cupaniana, Thalictrum dipterocarpum, Anthericum liliastrum maximum, Libertia formosa, Anemone japonica Lady Ardilaun, Queen Charlotte, Campanula persicifolia Telham Beauty, Scabiosa caucasica, Romneya Coulteri, Chelone barbata, Salvia patens, S. uliginosa, and S. virgata nemerosa, Agapanthus Mooreanus minor in blue and white, Geranium armenum, Lilium candidum, L. testaceum, L. Henryi, L. regale, Aconitum Wilsonii, Monarda didyma Cambridge Scarlet, Lychnis chalcedonica, Œnothera Lamarckiana, O. Missouriensis, O. taraxicifolia, Catananche cœrulea, Chrysanthemum maximum Mayfield Giant, Dictamnus fraxinella, Veronica incana, V. candida, Verbascums in variety, Sedum spectabilis, S. Ewersii, Echinops humilis, Echinacea purpurea Rose Queen, Sidalcea Sussex Beauty, Dieramma pulcherrima, Eremurus in variety, Eryngium tripartitum, E. amethystinum, Gypsophila paniculata, Gillenia trifoliata, Helenium Riverton Beauty, Phlox decussata in variety, Linum narbonense, Lavendula nana compacta, Bocconia microcarpa, Kniphofia Gunton Park, K. Goldelse, Iris in variety, Incarvillea Delavayi, Helianthus orgyalis, Geum Lady Stratheden, and Potentilla Warreni. Annuals: Fedia cornucopiæ, Phacelia campanularia, Rhodanthes in variety, Cornflower Kaiser Wilhelm, Lavatera Sunset, Adonis aleppica, Delphinium Blue Butterfly, Silene orientalis, Mignonette Golden Goliath and M. Machet Red, Gilia tricolor, Madia elegans, Arctotis breviscarpa, Hunnemannia fumariæfolia, Nemophila insignis, Clarkias in variety, Stocks and Asters, including the single Chinese (Callistephus) Calandrinia grandiflora, Bartonia aurea, Argemone mexicana, Annagalis grandiflora cœrulea, Alonsoa Warscewiczii, Acroclinium roseum, Dimorphotheca aurantiaca in variety, Eschscholtzias, Sweet Scabious, Didiscus cœruleus, Nemesias in variety, Phlox Drummondii in variety, Viscaria cœrulea, and Salpiglossis.

Using Gypsophila as a foliage plant

(Amateur).—Strictly speaking, Gypsophila is a flowering plant and not foliage, and unless schedules are worded to the contrary it should not be used as a foliage plant. Persons using it as such should be disqualified.

Plants to furnish cut flowers

(Flower-lover).—All the plants you mention would probably thrive on your soil, but shelter to a certain extent is necessary for the Romneya. These and the following are excellent for cutting:—Gladiolus, Hyacinthus candicans, Tiger Lilies, Lavatera, Chelone, Scabious (all kinds), Gypsophila paniculata, G. Rokejeka, G. elegans, Annual Larkspurs, Eryngiums (all kinds), Kniphofias, Yucca filamentosa, Phlox decussata in variety, Achillea ptarmatica The Pearl, A. eupatorium, Bartonia aurea, Mignonette, Silene orientalis, single Asters, Salpiglossis, Clarkias, Lupinus affinis, L. polyphyllus, L. arboreus, Michaelmas Daisies in variety,
Galega Lady Ardilaun, Anemone jap
variety, Border Carnations and Pinks
the pallida section, also English and
Iris.

Soft rot in Irises

(R. F. S.).—This disease (Rhizon
can be recognised at once by its ch
istic smell, the rhizome becoming s
slimy. The best treatment is to
plant attacked and carefully cut a
diseased portions of the rhizome. It
then be washed in a bright pink sol
potassium permanganate, replanted i
soil, and sprinkled with superphosp
lime. This should be washed in wit
if the weather is dry. An ounce or
superphosphate to the square yard s
over beds of Bearded Irises at fl
time should check the disease and
same time provide the plants with t
they need, care being taken to ap
superphosphate while the leaves a
Good drainage and plenty of lime
into the soil is absolutely essential.

Sweet Peas diseased

(Ardene).—The plant arrived in go
dition and is similarly affected. T
little you can do to improve matters
present time except to keep the plan
supplied with moisture, damping the
overhead frequently. When prepar
soil for next season's plants trench
deep and work in plenty of farmyard r
mixing the latter thoroughly with the
being a great mistake to leave ma
layers at any time. Also add a good
of freshly slaked lime to each foot
avoiding all artificial manures an
should get satisfactory results.
sprinkling of bone-meal worked into
8 inches will, however, prove benefic
even this must be used in moderation

Delphiniums

(A. W. R.).—Of course, such a t
possible, but we would not care to
ourselves to an opinion at this late d
having seen the plants. We would
you, however, when ordering further
to insist upon them having been gr
this country. It is a well-known fa
Iris, Delphiniums, Pyrethrums, and
plants imported from abroad, and whi
have been in packing-cases for wee
also kept in hot storerooms waiti
auction sales, are notoriously difficult
into growth, hundreds of such plant
lost annually. Always plant your ne
phiniums at the end of April, when, pr
the plants are healthy, you will alm
tainly succeed with them.

Plagianthus Lyalli not flowering

(Querist).—Your Plagianthus is, pr
suffering from want of nourishment
plant six years old should be much
than yours. Given a little help in the
mulching with old farmyard manure it
only be a question of time before it
freely. This shrub requires very
pruning, a mere thinning of dense
occasionally being all that is necess
desirable, and this should be done dur
winter months. The writer finds this
some shrub to be happiest and most e
when growing in a partially shaded p
and sheltered from cutting winds, a
bushes 18 feet high and a mass of bl
the present time.

Rose Black Spot

(S. S.).—Your Roses are affected
Black Spot, due to the fungus Actin
Rosæ. Leaves which are nearly fully
are those most frequently attacked.

infection varies with the variety of some being completely covered with ease, but others only show isolated s. If the disease is bad early defolia- sults, followed by a crop of new leaves at the ends of the branches from which ought not to break until the ng spring. This results in weakened The wood of Rose plants is, in ases, attacked, and in this case the d portion shows a blistered, blackened ance. All diseased leaves should be d and burned, and the healthy foliage yl with a weak solution of liver of r. If all the leaves are infected you ot, of course, remove them at this but spray with liver of sulphur to as much as possible the spread of ease in autumn. Collect and burn the eaves and cut away the infected wood, Follow this by spraying at intervals e above fungicide, beginning early in

FERNS

ed Ferns

Marcan).—The specimens arrived in dried-up condition that it is impossible to form an opinion as to the cause of uble. If you will send more specimens in a tin box we should be pleased to e them for you. Messrs. Perry, Plant Farm, Enfield, could supply you erns for your rock garden.

TREES AND SHRUBS

e trees not fruiting

you suggest a cause for my Euonymus us dropping all its fruits while they quite an immature state? The bush en in its present position four years s never ripened a single fruit, though uces flowers in great abundance. I a heavy dressing with old mortar- last year, and always water it well the fruit is forming. A bush of E. in quite a different part of the garden, has very little lime, behaves in the nanner. Both are well in the open.

x. A. H. W. D.

eral species, notably E. europæus and nicus, are frequently badly attacked aterpillar during their flowering sea- hich swarms on the branches in cob- masses, feeding on the leaves and pre- the formation of a crop of fruit. A and effective remedy is to spray the th an arsenical wash. A solution of Green at the strength of 1 oz. to 12 of water may be used. This may een responsible for the bushes not , although the latter is by no means ruiting species at any time. We do nk it is a question of lime. Trees of opæus are known to fruit profusely y in soil absolutely free from lime. s at the root may have had some- o do with their non-fruiting, and we that you try a plant in partial shade.]

FRUIT

ing Apples

F. I. Johnson).—The cause of your dropping is undoubtedly imperfect tion. If you open the fruits in ques- u will find that the pips have not ed. This imperfect fertilisation may to one of several causes. Because p bees it is not safe to assume that l always obtain a crop; you are more o do, but that is all. The dropping of Apples at this period of the year is a t source of trouble to gardeners, and own as the "June Drop." Spraying rtain fungicides is known to increase the loss, but in your case it appears to us that your trees are suffering from lack of plant foods in the soil. Those that are in grass should receive a dressing of an equal mixture of slag and kainit at the rate of 8 ozs. per square yard. The mixture should not be spread just around the roots, but over the whole area under grass. The trees in cultivated land should have a mixture of slag and kainit as above, and this dressing should be followed next spring by giving sulphate of ammonia at the rate of ½ oz. per square yard. Again, the whole area should be dressed, and not just around the roots. The slag and kainit mixture should be applied to the grass at once, but if the open land is carrying a crop you should wait until the crop is taken off. Continue with the winter washing of your fruit trees. Write us again if we can assist you further.

Diseased Apples

(R. Augell).—Your Apple specimens are badly affected with Apple Canker, and to a lesser extent with Apple Scab. The control for the first trouble is to cut out and burn all the affected growths, especially on the younger portions of the trees. Certain varieties of Apples are very prone to canker badly on some types of soil, and it is wise to avoid such varieties under these conditions. The control of Apple Scab consists in spraying the trees in the so-called "Pink Bud stage"; a second spray is given when most of the petals have dropped from the flowers, followed by a third wash three weeks later. Lime sulphur or Bordeaux Mixture is used as the fungicide, the former being the easiest to prepare in small quantities.

VEGETABLES

Cucumbers flagging

(C. C.).—Most likely your Cucumber plant has been attacked by that distressing disease which is caused by the very tiny eelworm which rejoices in the name of "Anguillulæ," and the only known cure is to pull up and burn at once. The soil should also be removed and fresh, sweet compost brought in in its place. This is all that can be done now, but for another season all the old soil should be removed and entirely fresh material brought in during the winter. Before planting in spring a fair dusting of lime and soot should be given the soil, as this helps to keep the pests in check.

MISCELLANEOUS

Borage for cider cup

Will you, please, inform me through the means of your paper the proper name of the Borage which is used to put in the cider cup, and addresses from which I can procure plants. I am informed that the usual garden Borage, which grows from 18 inches to 3 feet high, is not the correct variety.

W. A. R.

[We think you have been misinformed about the kind of Borage that is used for flavouring cider cup and other summer drinks. It should be the ordinary Borage, Borago officinalis. Seed is in every seed list. It is an annual, and can be sown either in spring or autumn. The following quotations may serve to convince our correspondent:—In Vilmorin's "Vegetable Garden" we read: "It is sold chiefly for making claret cup." In Weathers's "Practical Guide to Garden Plants" it says of Borago officinalis: "This is the species used for flavouring drinks." In that useful old book, Johnson's "Gardeners' Dictionary," it says: "Being aromatic it is put into negus and cool tankards." In the "Treasury of Botany," by Lindley and Moore, we read: "Borago officinalis, when steeped in water, imparts coolness to it, and is used in the beverage called cold tankard."]

R.H.S. Rules for judging

(Judge).—The publication you require is the "Rules for Judging at Horticultural Exhibitions," price 2s. 6d. This is obtainable from the Secretary, Royal Horticultural Society, Vincent Square, Westminster, London, S.W. 1.

Name of pond weed and method of eradicating same

(Norvic).—This is the Spiral Tassel Pond Weed (Ruppia maritima), which can be kept under control by hand-pulling or cutting away with a long-handled hook or scythe. When cut it will come to the surface and can then be removed. If this is done frequently and the plant kept from seeding it becomes less difficult to control. Sulphate of copper will not destroy this weed, and we know of no remedy other than that given above.

Compost bed for a country house enriched from a septic tank

For some years I have been collecting household refuse, together with grass cuttings, weeds, etc.; in fact, anything that will rot. This material was placed on iron plates draining to a trough. Every day or so a little liquid was thrown on to the heap, which trickled back into the trough ready to be used over again. Temperatures as high as 120 degs. were recorded in the centre of the heap. In a year everything was well rotted, and I could not detect any great crop of weeds from its use. Another experiment made during last winter was the pouring of household slops daily over a heap of decaying leaves. Maximum temperature recorded during cold weather was 90 degs. F. The leaf-mould was found to be thoroughly rotted in six months. The heap was turned once. I am now moving to a country house in which the drainage (with the exception of the bath water) passes through a septic tank. Will you kindly advise me as to its best use with decaying vegetable matter, including leaves? (1) Can the liquid be drawn direct from the septic tank? (2) Query in such daily amounts that the level of the liquid is not sensibly lowered. (3) Should the pumped liquid run into a trough to be used again, or will once through the compost heap be sufficient? (4) What vegetable matter should be burnt? (5) I understand that Nettles are particularly rich in potash. Should they be cut before the seeds form? (6) Is it an advantage for earth (mostly sandy loam) to be mixed with the compost from time to time? If so, in what proportion? (7) What is the length of time that should elapse before the compost is used? (8) How would such a compost compare in manurial value with farmyard manure? As we shall be very short of water I am proposing to run the bath water, after filtering, to a Lily pond and afterwards to a bog garden. Are there any grave difficulties in its use?

LOUIS BARROW.

Little Comberton, Pershore.

[The best way of making a compost heap is to put a layer of garden rubbish about 6 inches thick and to lightly sprinkle with lime, then cover this layer with a layer of soil about an inch in thickness. Repeat the layers of rubbish and soil alternately until the desired height is reached. The heaps are usually made up as the materials become available; the lime is used to hasten the decay. If the heap is well made no drainage should take place from the heaps, as the soil used should soak up the moisture. The effect of pouring water or liquid-manure over the compost heap will hasten decay, and if the latter is used the resulting material is enriched in plant foods. When such liquid is used more soil is used in the make-up of the heap, so that drainage does not take place. A compost heap so formed is not usually turned, but after leaving for a year is chopped down and used as manure. It is impossible for us to answer your questions in connection with the septic tank, but the firm who constructed it should be able to do so. We understand that in the case of a well-constructed tank of this description the overflow should be clear water only. As to the desirability of taking out a portion of the liquid we cannot express an opinion. You certainly should not use sufficient liquid so that it runs out of the heap, because the water draining out will take with it the whole of the nitrate, which is the most valuable portion. All diseased material and anything of a woody nature, which would not decay fairly easily, should be burnt and not placed in the compost heap. We have no record of actual experiments comparing farmyard manure with compost heap material, but experience teaches that compost material makes good manure. All green material contains its maximum amount of plant food just before the flowering period. If your filter removes the soap from the water we see no difficulties in your using the bath water as suggested. Please note that we do not reply to queries through the post.]

Clover in lawn

(M. B.). Dress the lawn with Anti-Clover Mixture at the rate of 3 ozs. to each square yard. One or more dressings may be necessary before the Clover entirely disappears, leaving a fine grass surface. This is obtainable from Messrs. Willis Bros., Harpenden, Herts, and other good horticultural sundriesmen. It will be advisable to apply the Anti-Clover Mixture after rain has fallen and the day fairly settled.

SHORT REPLY

F. W.—Try Corry's White Fly Death, but be sure and follow instructions carefully. By dealing with White Fly at once you may eradicate the pest. If neglected, even for a few days, it becomes increasingly difficult to deal with.

GARDENING APPOINTMENTS

Mr. GEO. H. COPLEY, N.D.H., Parks Superintendent to the County Borough of Dewsbury, appointed Superintendent of Parks and Cemeteries in the city of Hull.

Mr. W. OATES, formerly head gardener to Sir H. COOK, Bt., of Cintra, Portugal, now head gardener to B. E. SMITH, Esq., of Chuniana, Malaga, Spain.

Fashions in garden planning

NEVER were truer words written than those of Pope, in which he says: "Whatever day makes man a slave takes half his worth away," if they are applied to gardening, for in no occupation is freedom of thought and catholicity of taste more essential, and with these slavery of mind is incompatible. One of the most uncompromising tyrants and sternest opponents of liberty in either taste or thought is fashion, whether it exercises its baleful influence in dress, art, architecture, or gardening. In the latter she has found her victims as plentifully as elsewhere. Then we wonder if the right men find their wrong occupation in gardening. But is it the gardeners' fault at all? Seldom, we are forced to admit, when we see what fashion does with the public generally, and weakly and fully the latter gives way to her in other directions. So the misguided crowd craves for this or that fashion in gardening, and the gardeners must provide it.

Consequently, during the last 100 years we have been led to believe in many "correct and only" styles. We have meekly accepted the stern decrees of "Capability Brown" and sought salvation in the spacious splendours of landscape sweeps and stretches. Then followed the assurance that the true and correct faith could only be found in Italian parterres. Equally sure that it was to be discovered nowhere else but in the gardens of France, we passed from one slavery to another. Afterwards, reinforced by a patriotic fervour, we found salvation in our native land again, only to be assured once more that we were mistaken, and that it resided not in old English gardens, but in those of Japan.

All this time the earnest seeker for truth is asking himself in which of these styles is it to be found, and the correct answer is, in none, in all. In these last four cryptic words lies the secret and mystery of true garden planning. Not in fashions and fancies, but in truth and sincerity is the correct style found. To many gardeners the question that will suggest itself at this point is that of Pontius Pilate: "What is truth?" Well, it is not discoverable in romanticism carried out in a small suburban garden, nor in landscape effects on a 7-acre recreation ground. Just as the architectural genius would never think of getting a Spanish atmosphere by a building on the Grampian hills, so the garden artist would beware of trying to Frenchify a quarter-acre plot in suburbia.

Yet garden art is catholic and wide in its tastes, and no country possesses a monopoly of style. People in England who cannot
travel to Italy still wish to see what he
are like, and so the Italian style ne
be taboo. In our larger parks and ga
where the contour of the ground a
immediate surroundings suit, the Ital
French parterres may well find a plac
to place them where neither of these
tions assist is as bad as preferring the
lish style where it lacks congruity.
people regret the departure that was
from the old Italian formalism in Re
Park years ago, which forms an apt il
tion at this point of our subject. He
surrounding mansions, the contour
ground, the natural lay-out of the pa
this portion, all favoured the style.
effect was very fine and gave joy to
thousands who used to visit regularly t
the changing beauties during the seaso

In few places could this style have
adopted to better effect, and one wor
what considerations prevailed, except fa
to bring about the change. With eve
sire to do justice to the results, can w
that they justify the alteration? The
vases, however beautiful they look wh
their best, scarcely offer an affirmative.
now appear to be out of place, and d
consort well with the present-day arr
ment. In a certain town on our sou
coast an attempt at making the Italian
supersede an English lay-out is succe
in making a lovely public garden neithe
thing nor the other. This is becaus
surroundings are purely and intensely
lish, the contour of the ground, too, le
itself only to the native style, which it
have been wisest to follow.

In the first case there is little doubt,
or fashion had much to do with the ch
in the second it was a matter of local
ences—and these not natural ones. The
able gardener is he who can rise super
fashions and whose intellect prevents
faculty of imitation from running to see
bringing him down to Simian level. He
be unmoved by the fact that a sunk ga
pond, and fountain have been planned
near neighbour, or that a raised terrac
vases have been artificially schemed
another. Even such things as crazy-pavi
topiary work will have no dominatin
fluence over him. He will take his own
of ground, be it big or little, and, consid
its surroundings, will plan it on such
that for that particular situation it shall
picture difficult to improve upon.

The garden planner should be an arti
instinct and training. Then he will
that, like all art, his must be based o
eternal principles of truth, sincerity,
honesty. Truth cannot be expressed in s
and mere imitations, nor sincerity in t
ferring plants from situations where the
right to others where they are anachron
or mere pretences. Honesty involves
right and sympathetic use of the materia
hand, whether stones, bricks, shrubs
plants, and fidelity to the claims of the
roundings. No artist can ignore these
principles, and the gardener who endea
to do so has missed his vocation.

A. W.

Francoa (Bridal Wreath)

The Francoas are Chilian plants belon
to the Saxifraga family. The three p
pal species have been in cultivation sinc
early part of the nineteenth century.
are handsome herbaceous perennials, s
what tender, and only hardy in warm l
ties and in dry, sheltered positions.
may, however, be grown in pots and pla
out in the summer. Grown in pots
greenhouse or conservatory decoration
make a fine display when in bloom d

ly summer. They are also very good ting, as the long, branching stems hite or pink blossoms 2 feet or more hich are extremely graceful. The flowers of F. ramosa are copiously d in much-branched racemes from 3 feet high. F. appendiculata bears of a pale reddish colour in a more t raceme. The flowers of F. sonchi- e loosely arranged and rose-coloured. atter is the hardiest species. Pro- n by division of the plants in spring seeds sown in gentle heat in spring, ly hardening off the plants if intended door work. J. L.

WS IN ADVERTISEMENTS

g the thousand-and-one brands of that are offered to-day, the old- hed firm of Walter Carson and Sons minent with greenhouse paint, virtues of "Vitrolite" have been to our readers for half a century. a ready-mixed white paint of great ty and of special covering power, ries with a hard enamel-like finish. upplied also in light stone colour. and varnishes of every description all purposes are made by this firm, ly popular lines being "Coverine," undercoating suitable for all interior one coat of this transforms a black into white); "Muraline," a flat, e distemper water paint for walls lings (work done with this can be without washing off); "Hard , a quick-drying paint suitable for in- d outside work, dries with a hard, y surface; "Plastine" imperishable ecommended for leaky glass roofs or d of glazing work; it withstands all tures and obviates the expense and trouble of constant renewals. Carson's brands are obtainable from leading ironmongers and stores everywhere. Shade cards and full particulars can be had from the works, Lombard Grove, Battersea, S.W.

Player's

The manufacturers of Player's Navy Cut Cigarettes are always in the forefront with improvement in packing. This time, following on their innovation of cutting back the top flap of the slide portion (which ensures easier extraction of the initial cigarette), they are the first manufacturers to help those who have found difficulty in opening in the dark the right end of the packet. Player's packets are now embossed on the "push-end." Theatre and cinema smokers please note!

CATALOGUES RECEIVED

Anthony Roozen, Haarlem, Holland.—Bulbs, herbaceous plants, Roses, etc.

John B. Vanderschoot, Ltd., Hillegom, Holland.—Bulbs, perennials, and Roses.

Holden Clough Nursery, near Clitheroe, Lancs.—Alpine and hardy plants.

LATE NOTES

A cup for Gladioli

The annual competition for the Foremarke Challenge Cup for Gladioli will take place in 1929 at the Royal Horticultural Society's fortnightly show in the Society's new hall in Greycoat Street, Westminster, on August 13th. The Cup is offered for the best 20 spikes of named Gladioli in not fewer than 10 varieties. Not more than two spikes of any one variety may be shown. The competition is open to both amateur and trade growers. Entry forms may be had on application to the Secretary, Royal Horticultural Society, Vincent Square, Westminster, S.W. 1, by whom the completed forms must be received not later than by the first post on Wednesday, August 7th, 1929.

Scottish National Sweet Pea, Rose, and Carnation Society

The Committee of the above Society have decided to continue the trials of Sweet Peas not in commerce in 1930. Twenty-five seeds of each variety must reach the Secretary not later than the last week of September, so that all can be sown on October 1st. Five shillings for each variety must be sent along with the seeds.

JOHN SMELLIE,
Hon. Secretary.

Westwood Cottage,
Helensburgh, Dumbartonshire.

Crossgates Show

Some excellent exhibits were staged at the fifteenth annual show of the Crossgates and District Horticultural Society held in the Manston Schoolrooms on Saturday, July 27th. The opening ceremony was performed by Mrs. A. E. Ives, of Roundhay, in the unavoidable absence of Alderman Hugh Lupton. Mr. W. M. Gray, of Crossgates, retained the Hugh Lupton Challenge Cup, the premier award in the Sweet Pea classes for members. He also won the Royal Horticultural Society's Silver and Bronze Medals.

Dr. Todd, of Killingbeck, was awarded the Burniston Challenge Bowl for the best cut Roses.

Shallots

Lift and store these, choosing a dry day for the purpose; should the weather be dry and settled a few days in the open after pulling will improve their keeping qualities.

IN FLY ON ROSE TREES. Keating's Powder
these plants will remove all trace of Green
dwill not hurt the plant. Use dry: keep dry.

A BURNING QUESTION
Do not burn your garden refuse; it is wasteful. Ensure a supply of excellent organic manure by treating lawn mowings, leaves, weeds, and general vegetable refuse with ADCO. Results prove that Synthetic Farmyard Manure made by the ADCO PROCESS is the most effective substitute for animal dung. The manure shortage is a serious question, but
ADCO WILL ANSWER IT
ADCO and water added to refuse as it accumulates will produce a rich clean manure in from two to six months; thousands of tons are made annually by gardeners, farmers, fruit growers, nurserymen, schools, and institutions.
One cwt. of ADCO makes 2 to 3 Tons of Manure
ADCO ACCELERATOR
For use with soft green refuse 28 lbs., 4/6; 56 lbs., 8/-; 1 cwt., 15/-
STANDARD ADCO
For use with tough material .. 28 lbs. 6/3; 56 lbs., 11/6; 1 cwt., 22/-
Reduced prices for 5 cwt., or more. Cash with order. Carriage paid to nearest Goods station.
Your Corn and Seed Dealer stocks ADCO.

Lilies in S.W. England

E my article entitled "Lilies now Flower" appeared, the abnormal ght of July caused many Lily en- s considerable anxiety.

kinds, where, for various reasons, has been withheld, have now lost hness, and in some cases the disease y known as "sunstroke" is taking oll of some of our favourites.

the last fortnight, in South-West particularly in the chalky districts, onna Lily has made a magnificent One particular cottage garden I have hidden away in the centre of was literally full of some of spikes it has ever been my to view. If any doubts ever s to the Madonna Lily liking soil I am sure this particu- ing would have removed all ty.

planted bulbs of candidum s u m, the black-stemmed Lily, are not looking so as the ordinary variety; one ppear to be suffering from a ack of Botrytis. The spray- lphide of potassium has, how- t this in check. Although undoubtedly a fine form of , in my opinion it hardly e difference in price.

days since, a magnificent the hybrid Lilium Marhan seen growing to perfection d garden not far from here rough undergrowth, while yards distant bulbs of the Martagon, planted in the t autumn, were an utter . Although both Marhan and are base-rooting Lilies, parently love the partial shade woodland and shrubbery.

excelsum is now in its full This beautiful Nankeen- Lily is one of the aristo- he family. It has stood the remarkably well, but showed distress a week or so since, when good soak at the base and syring- ead in the evening acted as a good wo, however, collapsed completely. e now in this particular planting spikes, 5 feet high, carrying from flowers.

croceum, although considered e hardiest of Lilies, is not looking ly happy, and while a large num- of perfect size, shape, and colour, to, having got to the stage of flower- ed yellow and died. A planting bulbs, collected in Italy of this Lily, appear to be standing the drought remarkably well. Quite a number are flowering. They vary considerably in shades of colour, and in some cases foliage is narrow compared with the species usually found growing so profusely in gardens in Ireland.

The true Lilium Brownii is doing wonderfully well. It is perhaps not quite so tall as we have been in the habit of seeing it, which is probably due to the very dry season. Its lovely creamy-white, trumpet-shaped flowers, chocolate brown anthers, and pleasing fragrance places it in the forefront of hardy Lilies. Moreover, it is not averse to a certain amount of lime and chalk in the soil. I have never tried the Japanese Brownii odorum under similar conditions, the true Brownii being, in my opinion, a more refined and desirable species.

Lilium candidum, one of the best known and loveliest of Lilies. Seen in almost every cottage garden

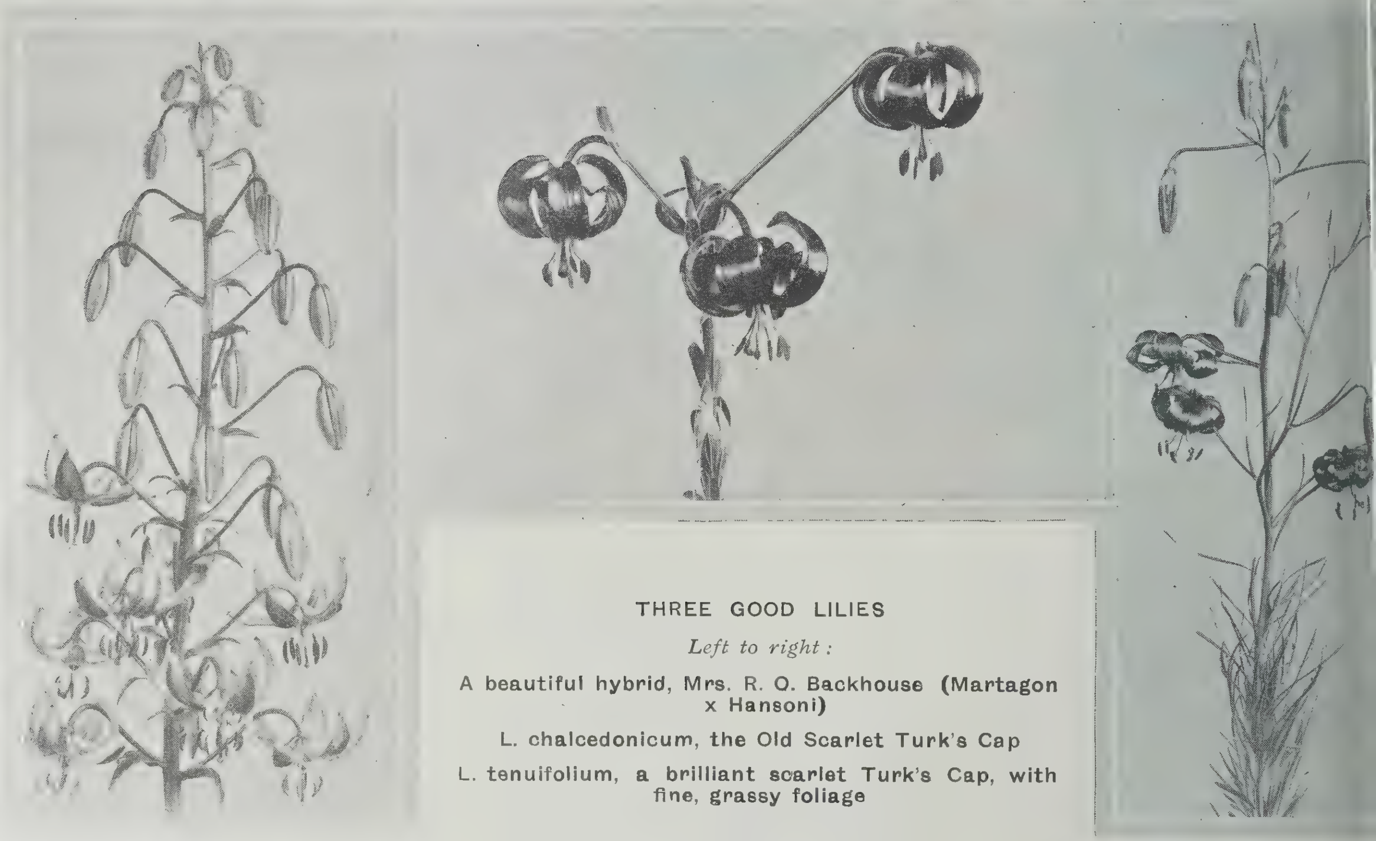
Lilium giganteum, the notable Himalayan Lily, is doing its best to repay for the little extra attention bestowed at the time of planting, and the occasional soakings it has received during the drought. Bulbs of flowering size were planted last October in a small shrubbery walk. Soil was taken out to a depth of 2 feet, the bottom being covered with a layer 4 inches to 6 inches deep of crocks, small stones, etc. This was filled in with a compost of three parts leaf-mould and one part loam, in which the bulbs were planted, with plenty of sharp sand around them, about 1 inch of soil covering the crown. Although this Lily makes a bulb of tremendous size, deep planting is not advisable. During the winter and early spring a covering of old leaves was applied. To-day the result is seen in its magnificent heads of long, white, tubular-shaped flowers, streaked purple internally. This Lily, if grown in the right position, is desirable on account of its beautiful, dark green foliage, apart from the beauty of its majestic spikes.

The one Lily which is just coming into flower, and which has received no moisture other than the little rain we have had, is the brilliant Scarlet Turk's Cap, Lilium chalcedonicum. A planting made last November is, considering the short time it has been established, doing remarkably well. Eighty per cent. are throwing flowers, and if it is possible to leave the bulbs undisturbed it should next year provide a wonderful splash of colour.

A few years since a good deal was written concerning the growing of Lilies from seed, and a certain amount of interest was then created, but for some reason or other this particular method of increasing stock has not received the attention it deserves. With certain kinds it must be admitted considerable patience is required. One or two species, however, mature very quickly, and with these time cannot be the excuse.

In the cool house here, a batch of 80 to 100 magnificent plants of L. Philippinense formosanum Wilson's Var. are now in full bloom, some of them carrying as many as five flowers. When looking at these plants one would hardly credit that it is less than two years since seed was sown. There is no difficulty whatever in flowering this species 14 months from seed, and I believe I am correct in stating that on one occasion Mr. Comber flowered this species nine months from seed. I am trying 50 or more of this Lily in the open, and while one or two were rather badly hit by a late frost, I notice quite a number are going to flower. At Castle Kennedy it has established itself, growing 4 feet to 5 feet high, its only drawback being that there it usually flowers too late in the season to produce seed.

Lilium Willmottiæ is another species which is showing buds 18 months from seed, and



THREE GOOD LILIES

Left to right :

A beautiful hybrid, Mrs. R. O. Backhouse (Martagon x Hansoni)

L. chalcedonicum, the Old Scarlet Turk's Cap

L. tenuifolium, a brilliant scarlet Turk's Cap, with fine, grassy foliage

although one cannot expect a fine specimen spike from a bulb of this age there is a certain amount of satisfaction in having one or two flowers without having to wait four or five years.

Other species well worth considering, on account of their rapid growth from seed, are L. regale, which can be flowered successfully two to three years from seed, L. Davidii two to three years, and most of the Martagon varieties three years.

Where the protection of a cool house is possible I would advocate sowing Lily seed in light, sandy soil, immediately the same is ripe, transferring the seedlings to small pots when the second or third leaf appears. Later, when the bulbs are making good root, they can be planted out into their permanent quarters. On no account should they be allowed to become pot bound. Where no protection is available, seed should be sown in the spring. A special bed in a sheltered position should be prepared for this purpose. A compost of equal parts loam, leaf-mould, and sand, sifted finely, is usually satisfactory. Sow shallow—a thin surface covering, is sufficient. Never allow the bed to become dried out. Keep just moist, encourage rapid growth as much as possible. Care and attention in early stages of growth will bring their reward.

Even one or two bulbs of the rare Lilium centifolium, less than four years old, threw single buds. These, however, with the exception of one, were pinched out to strengthen the bulb. The one left is, at the time of writing, in flower.

A bulb of the true Lilium nepalense (not ochraceum) will, I hope, be in flower during the next three weeks. A bulb I had the pleasure of sending to Kew has already flowered, and has proved to be the true nepalense, which has never yet been in cultivation. The bulb is quite small compared with ochraceum, and somewhat more conical in shape. Last year it flowered the second week in July, when it carried three blooms of greenish gold, stained at the base deep wine purple, similar in colour to ochraceum, but much less reflexed. It appears to be of stoloniferous habit, and grows about 2½ feet high. It is, rather more interesting than beautif

Lil

Looking backward

THE interesting article by Thackeray Turner, issue July 20th, on "Pests and Diseases" should prove to be a welcome help to many of your readers, and considering the wide field that it covers, I feel fortunate in being able to give the result of my experiences in fighting some of the enemies that he has not as yet got the better of.

With regard to the Nut trees, I always spray these with arsenate of lead at the same time as the Apple trees, and find that this quite checks the depredations of the weevils, and results in a sound crop of Nuts. It may be of interest to those who have had their garden Peas eaten off by mice when just pointing through the surface to know that this can be entirely prevented by lightly spraying the rows of Peas with arsenate of lead also.

Now as to Big Bud, the result of careful experiments at one of the Kent Research Stations is that this pest can be almost entirely prevented and cured by the application of lime-sulphur at winter strength sprayed on the bushes in the spring when the leaves are grown to about half their full size. It might be thought that the young and tender leaves would be injured by the lime-sulphur, but my bushes so treated this spring are now carrying a good crop of fruit.

Until about four years ago I regularly had more than half of the buds on Prunus Pissardi, P. triloba, and several varieties of eating Plums pecked out by the bullfinches which always come in flocks of a dozen or more; but that is a tria past now. The bullfinches come, buds remain, and time, powder, and saved, as well as the lives of the bul which doubtless do good in some oth of life.

The remedy is a simple one an made. Take any old tin canister not gone rusty, preferably a flat-si cut it up into sides, bottoms, etc., a these flat sheets cut pieces measurin 3 inches long by 1 inch wide. Near of each of these slips punch a sm pass a string about 12 inches long the hole and make fast, then hang it near the end of a branch. Three t more strips, according to the size bush, will be required. The light from the bright surface of the tin, constantly spinning, effectually frigh birds. Of course, this idea might b rated by the substitution of som corrosive metal for tin, which rus being exposed for a week or two.

"What is the matter with the berries?" is a question now asked gardeners, and as far as I am aw remains unanswered. In a small have been experimenting, and have h results by growing the plants on be above the normal ground level by inches. The beds are 3 feet 6 inch allowing room for three rows of pla the soil is kept in position by boa pegs along the sides and ends. This ensures perfect drainage during the and allows the frost to get into t ly sweetening and pulverising it. t point I consider most important, ows a good tilth to be obtained in r part of the season. I am convinced ood tilth to a depth of 6 inches is to the health of the plant. I do end that this method is a solution ifficulty, but I have had healthier nce adopting it.

on the subject of pests, some of your may have had losses in their young f Cabbages, Brussels Sprouts, and embers of the Brassica family, the is being discoloration and withere leaves, followed by the death of the The Cabbage Root Fly is the cause e trouble and is very prevalent this Having lost about one-third of my Sprouts, I sent a specimen of the plant, together with the fly, egg, a (which may be found round the art of the root) to the South-Eastern ural College, Wye, for examination, advised to hoe in around the plants ommercial naphthaline (grade 16) at of one quarter of an ounce to each vice, at intervals of two weeks. I lowed out this advice with satisfac ults. FRANK BURTON.

Primula pulverulenta

e grown a goodly number of these, h bloomed freely, set seed, which also many plants, some of which I gave ly at Purley. These, too, produced owers to the delight of the lady and nds. I recently wrote to her to inw they fared last winter by asking question: "Have the Primulas this year?" and this morning I ceived the following reply:—"I am say the Primulas did not flower this d I am afraid the severe frost and ght together killed them. Our soil light." G. C.

Garden weeds

el Wolley-Dod's notes on garden s in your number for July 20th, sugew words of warning about bringing eplants into the garden. There are ild things that are so beautiful in tural places that one is tempted to n as garden plants. The little Wood Oxalis Acetosella), that is so charmin shady woodland places, becomes an able pest in the garden. It gets into ts of Ferns and other plants, and elf unmercifully in more open places. surface-rooting plant and seems to easily, but always leaves something and appears again in quantity the ason. One summer day, rambling some waste ground, I came upon a ead patch of the common Scabious a arvensis). The plant is common in trict, but the flowers of this patch such unusual size and colouring that ere marked and the place visited again utumn, when the marked ones were and planted in the garden. It was a nough thing in the flower border, but it only too readily. Ever since I have ying to exterminate it, but the roots , and every little bit left makes a lant next year.

e yellow Loosestrife (Lysimachia), that is so handsome by a river-side, so, unfortunately, brought into the It has been a real pest, coming too not only where it was planted, but ng without evident reason in different f the garden, although it has never owed to seed.

pretty little Enchanters' Nightshade lutetiana), such an engaging plant damp, shady places where it grows naturally, was also admitted to the garden; an indiscretion that I have never ceased to regret, for the whitish roots form spreading masses that invade and overwhelm neighbouring plants, and though every year we fork it out as well as we can, yet it always comes again and grows rapidly. But the most regrettable lapse of all was when I brought home from a distant cornfield a root of the common Horse-tail (Equisetum sylvaticum). It was a piece of inexcusable folly, for I knew what a dangerous plant it was, and I had only brought it for a close examination of its curious structure, as I had not seen it for a long time. But I laid it in and then forgot it—with disastrous consequences. G. JEKYLL.

Dianthus x Enid

A charming hybrid Dianthus which I have now had in my garden for several years and which is of the easiest culture is that named D. x Enid, which is of hybrid origin and was raised, I believe, at Lissadell. I understand that one of its parents is D. deltoides, and probably the other is D. neglectus. In the garden I had prior to removing here in 1927 this little Pink was dwarfer than in the better soil here, and rarely exceeded 3 inches. In this garden, however, where I have it in three or four different positions, it is about 6 inches or 8 inches high. In character the flowers resemble those of D. deltoides, but are of a much deeper colour—a deep crimson—and have dark foliage. This plant forms a carpet of foliage and is easily multiplied by taking off pieces from the old plant, which divides quite freely. I have several plants in sunny positions in the rock garden, in a loamy soil with sand added, and have it also as a part of an edging to a border of herbaceous flowers. This Dianthus is absolutely hardy and well deserving the consideration of all growers of rock plants. S. ARNOTT.

From Gardening Illustrated

Fifty Years Ago

How to form a rockery

(In answer to a correspondent.)

TO imitate Nature in its various details is very difficult. Artistic rocks may be portrayed, but to build them to avoid detection is another matter. What materials has "A Constant Reader" at hand? Flint, scoriæ, or what has he got? If he has nothing he should buy some coke in large lumps. The groundwork should then be planned, not less than 4 feet from the wall, against which should be thrown the foundation in a slope to the height required in proportion, not forgetting to mingle with the rough at the bottom plenty of brickbats and other such material. Next get a pailful of thin Portland cement and water, into which the coke may be dipped, and quickly lay the front line in the most irregular and inartistic manner possible, avoiding straight lines. Raise this about 1 foot, draw the earth forward, solidate it where the next line is to come, and build on according to taste in whatever number of steps may be required, taking into consideration that the quicker it is done the better. Avoid arches; cultivate roughness, and bear in mind that the growth of the plants will, if given the soil in which they mostly delight, soon cover—and the quicker the better—all your artistic work. Avoid shells, quartz, or anything that will lead the mind away from the real object in view, viz., giving each plant the position it most delights in; that is the use of a rockery.—*September 13th, 1879.*

Ripe Gooseberries

I think the Goosebery the best flavoured fruit grown in England, either indoors or out; but most people laugh on hearing such an opinion. Those who have the best means of making the fairest comparison among all our fruits, or a good many of them, think as I do of the Gooseberry. The very name and hardiness of this fruit make it almost ridiculous to many amateurs, who do not mind spending a deal of time and trouble about Grapes. The flavour, indeed, of certain kinds of Gooseberries is, I think, only equalled by the Peach in its best state. GROSSULARIA.

The hardiest Helianthemums

We have over 30 varieties of Helianthemums in this garden. The plants, which were not more than two years old, have flowered very well indeed, but older plants have been entirely killed by frost. The age of the plant seems more important than the variety. Similarly a dwarf Hypericum which had become hard and woody was killed, but its seedling survived. Has anyone saved Polygonum campanulatum?

A. M. D. H. ROGERS.

St. Hugh's College, Oxford.

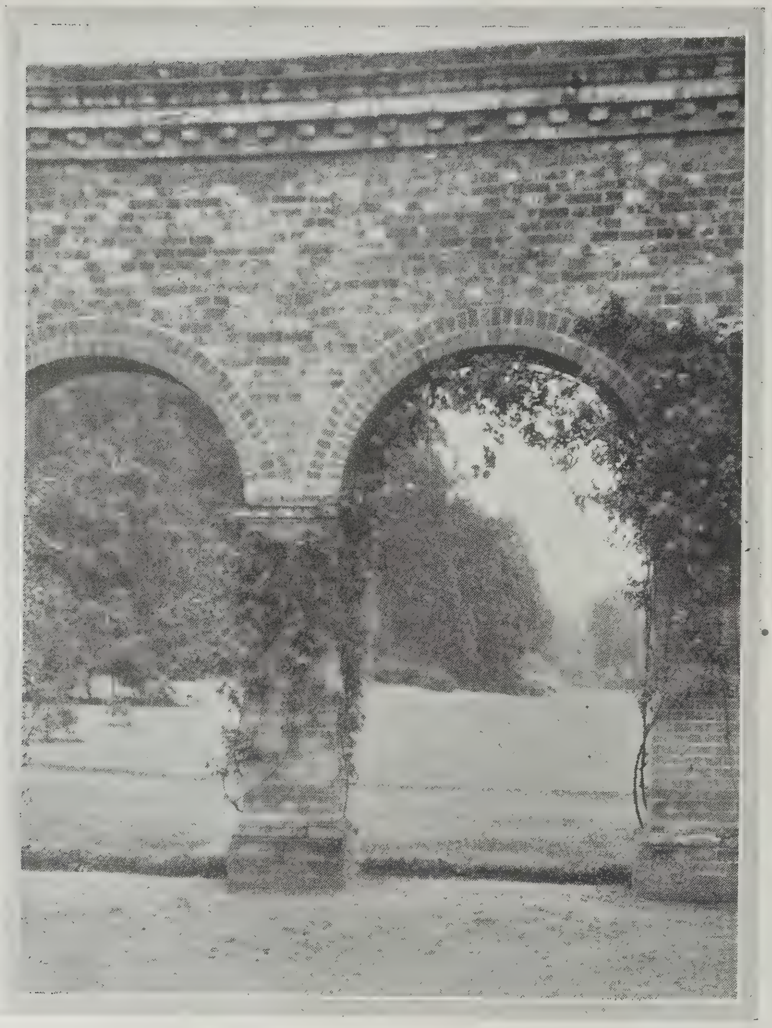
Saxifraga umbrosa—Elliott's Variety

This fine form of the good old London Pride should find a place in every garden. Like its ubiquitous relative it will grow anywhere, in sun or shade, but possibly prefers a little shade from the midday sun. The small and neat rosettes are coloured a lovely green, and in due season will produce a fine crop of pink blossoms, much more brightly coloured than those of S. umbrosa, and the whole plant is smaller and more compact than is the old species. Saxifraga Elliott's Variety should be planted in considerable colonies or drifts if its beauty would be fully realised. The massed blossoms will produce a piece of most effective colouring on the rock garden or in the forefront of the border. This Saxifrage was collected in the Pyrenees and is as easily increased as the old London Pride. RALPH E. ARNOLD.

Campanula Parryi

This is a dwarf, sturdy plant varying in height from 3 inches to 6 inches, each branch bearing a quantity of large, blue, drooping blossoms. It is similar in habit to C. rotundifolia alpina, but distinguished from that plant by its slender habit and the intense blue of the blossoms. The flowers, too, are larger and more cup-shaped, fully 1 inch across. It is a neat, slender kind, forming light, spreading tufts of tiny leaves and producing many flower-stems each supporting three to five drooping deep blue blossoms with a light, graceful, airy effect.

It is much more graceful in habit than our native plant and far more refined in colour, being, as a rule, not difficult to cultivate. It grows in neat, spreading masses about 6 inches high. The flowers are borne on slender stems in a loose, graceful manner. It succeeds in any position and is not particular as to soil, though it thrives best in soils of an open nature. The plants should be kept at least 6 inches apart as it spreads a little at the root. It is easily increased by division and quickly forms a stock sufficient for any garden. H. STEVENS.



Chiswick House and Its Grounds

ON July 4th His Royal Highness Prince George opened Chiswick House and its historic grounds to the public. The Brentford and Chiswick Council felt that the place so long connected with our Royal Family should not be allowed to be cut up for a building site, and with the help of the Middlesex County Council, neighbouring Local Authorities, and private subscribers, including a gift from His Majesty the King, the estate of 66 acres was purchased from the Duke of Devonshire for the sum of £80,000. It is important to note that no less than £3,500 per annum has been set aside for its maintenance.

We know that a house stood on the site in 1624, for at that date it was in possession of Robert Earl of Somerset. Charles II. purchased it for his son, the Duke of Monmouth, in 1668. In 1682 the first Earl of Burlington acquired the property, and the third Earl made it his country residence. With the help of Campbell and Kent he built the present "villa," as it is termed, or rather a mansion in the Paladian style. On his death the property passed to his daughter, whose husband became the fourth Duke of Devonshire. It is said that James I. made a secret visit to Chiswick House to see his disgraced favourite, Robert Earl of Somerset, but the most notable Royal visit was when Queen Victoria, the Emperor of Russia, and the King of Saxony were entertained by the sixth Duke.

King Edward and Queen Alexandra, when Prince and Princess of Wales, leased it, and His Majesty and the late Duke of Clarence spent some of their young days there. The two plots of ground which were the little Princes' gardens are still pointed out.

The gardens are well worth a visit, if only to see the fine timber. On the south front of the mansion an avenue of Cedars with an avenue of Limes on each side of it extends for 400 feet. On the north front there are three avenues 600 feet in length leading to two garden houses fashioned like ancient temples. At the end of a broad gravel walk there is a typical gate by Inigo Jones which much resembles the well-known one that serves as the entrance to the Oxford Botanic Garden. Some beautiful and famous iron gates once stood at "The Duke's Avenue" entrance, but these were removed from Chiswick to Devonshire House, Piccadilly, and stood there till 1921. They were, fortunately, saved to this country when that residence was demolished, bought by the nation, and set up as the Piccadilly entrance to the Green Park.

To return to Chiswick, in the park-like grounds there is a lake 2,000 feet in length and about 200 feet wide, usually fed by the Bollar Brook, though there seemed to be no water flowing from it when we visited it this week after the long drought.

The soil excavated to form this lake was used to form an embankment and raised walk to the south of the mansion, and from this raised and shady walk some charming
glimpses of the water and distant

4. A glorified Lilium ochraceum—L. nepalense of former years. Flowers yellow, stained almost black in the centre.

from the Chiswick House garden, and it stands to-day a splendid living monument to this pioneer of the Landscape School.

The alterations effected by "Capability" Brown in St. James' Park involved a tremendous destruction of fine old Elms which was said to have been "the best obliteration of avenues" ever accomplished.

The grounds surrounding old Buckingham House must have been charming in Queen Anne's time. There were wide terraces, the walls of which were covered with Roses and Jessamine, parterres, "water-works" and fountains, a canal 600 yards long, and a double row of Limes on either side. These were all swept away in the reign of George IV. and plain grass, a stiff artificial lake with bays, and a few clumps of trees substituted.

Bacon, who loved the green of the grass and yet would have his garden full of bloom throughout the year, would have been angered by being told that "the flower garden ought never to be visible from the windows of the mansion." At Chiswick House we have an example of this precept put into practice. It is a most interesting survival and a landmark in the history of gardening in England. H. H. WARNER.

Michauxia campanuloides

THIS plant grows 4 feet high, forming neat symmetrical growth. It commences to flower in July and remains in beauty several weeks. The flowers are white, suffused with rosy-purple. Although a biennial Michauxia campanuloides is well worth a little trouble to establish for its distinct character and the dainty beauty of its quaint, white flowers.

It is not difficult to please as regards soil or position, but will be found to thrive better on light and warm ones. Slugs play havoc with this plant, so the crowns must be well covered with lime or what is, perhaps, more readily available, finely broken clinkers.

H. F. STEVENS.

Michauxia campanuloides

Large-flowered Pentstemons

Among late summer and autumn flowers the large-flowered or florist's Pentstemon takes a foremost place, the modern varieties being of large size, both as regards spikes and single blossoms, while the colours in recent years have been greatly improved. Profuse in bloom and of graceful habit, Pentstemons have a special value for our flower beds, as they flower for many weeks.

When well placed in the garden, the Pentstemon is superb, its profusion of bloom creating fine masses of colour in late summer and autumn, especially when the best varieties are used.

The Pentstemon is so great a favourite, and there are so many beautiful forms, that those who want a border or bed of them may choose the kind and colour they like best. The cultivation of the plants does not call for any special skill or treatment. They will thrive in any good garden soil, and being so useful for so many purposes they should find a home in all gardens.

Although the Pentstemon is really a perennial plant, and in the mixed borders usually allowed to grow as such, the gardener generally finds it more convenient to treat it as a bedding plant for the purpose of filling beds and borders. The plant readily lends itself to this treatment, and, providing cuttings are rooted early in September, the resultant plants may be relied upon to give a bold and brilliant display the following summer.

Cuttings are the best means of propagating Pentstemons. These may be taken even as early as August. Side shoots that show no disposition to flower are the most suitable for the purpose. The cuttings must not be too long out of the ground, or they will quickly flag.

For the purpose of raising plants a cold frame is necessary. This must be filled with soil consisting of loam, leaf-soil, and sand. The cuttings should be pressed firmly into the soil and kept closely shaded and moist for about three weeks. When well rooted, free ventilation must be the rule at all times. During winter very little if any water will be needed. Early in May the plants may go to their permanent quarters. The young plants will stand a few degrees of frost if well hardened.

Of modern varieties there are a great many, and nearly every nurseryman has his own speciality. Particulars of these and other large-flowered kinds are given in any good catalogue of hardy plants. The following are a few distinct:—Mrs. Langford, Mrs. Edwin Beckett, Red Riding Hood, and H. J. Elwes. H. STEVENS.

Brompton and East Lothian Stocks

Raising plants for next year

The value of Stocks both for their fragrance and their beauty is not confined to the summer blooming or ten-week varieties so much as it used to be, as in recent years those who have greenhouses from which frost can be excluded are appreciating what an asset a batch of Brompton or East Lothians are to have for spring flowering under glass. The culture of plants in these sections is very simple; seed can be sown at once in pans or boxes of light loam and leaf mould, with a little coarse silver sand among it. If seed is sown thinly, and just covered with soil, germination at this time of the year will not be long, and before winter sets in plants will be large enough to pot off into 5-inch or 6-inch pots, in which they can be bloomed. The best quarters for them is a shelf in a cool house, not too far away from the glass, but where they will have plenty of air.
Brompton Stocks are hardier than th
Lothians, and will in a mild winter

obtained from that earliest ripened.
take a leaf out of the book of those
ake growing for seed their business.
not suffer plants to go on blooming,
mpt to gather, only from the best
g plants. Sweet Peas may be taken
xample among popular flowers. As a rule most folk want plenty of flowers for table decoration, and then when they think they have had enough they turn their attention to picking pods of seed. It is then that the plants after blooming for weeks—perhaps months—are low in vitality, and consequently seed from such a source is not worth very much to the grower for sowing next year. Only the best of the "first fruits" is worth considering. If you contemplate saving seeds of Mignonette, Marigolds, annual Larkspurs, and Love-in-a-Mist it will pay you to go to the trouble of setting aside a few plants for that specific purpose and restricting their flowering. Vegetable seeds, such as Peas and Beans, Broad, French, and Runner, ought to be selected from plants known to be healthy, and only from the best of the first ripened. As a rule, it is better to purchase vegetable seeds rather than trouble with saving. In any circumstances, it is a mistake to save the same kind of seed year after year. An object lesson in Potatoes and Runner Beans this year proved to me, had proof been necessary, that to save seed year after year is a losing proposition, and not worth a moment's consideration. The crops at the time I pen these notes will hardly be worth gathering. "I shall not save my own seed again," was the remark the owner made to me! W. F.

Propagating hardy edging plants

Those who desire their garden paths to be fringed with hardy edging plants another year should lose no time in propagating them, and, once established, they last a season or two without needing much attention. For instance, now is a suitable opportunity for getting in cuttings of Pinks. You cannot have a better or sweeter white than old Mrs. Sinkins. Another white edger will be found in the perennial Candytuft, especially the sort known as Little Gem. What blue flower has made more friends than the Catmint (Mussin's Nepeta)? Cuttings of this taken near a joint will strike very quickly. Many of the Saxifrages with their cushion-like growth are adapted for edgings to borders. Stormonth's Pink is one that comes on quickly and can be propagated from cuttings. You can have another pink-flowered plant about your paths, if you do not object to one which "sprawls," in the Soapwort (Saponaria ocymoides), with a reputation for flowering very freely. This, again, will strike from cuttings now. Not many view Aubrietias in the light of path-edgers, yet they, too, make a garden very charming in spring, and there is no difficulty in getting a stock of plants from cuttings if put in at once. Should you have some clusters of dwarf Campanulas, perhaps on a rockery, remember their worth for the verge of the path, and that plants can be pulled to pieces and the portions got in where they are wanted to bloom. WOODBASTWICK.

Frame plants that must have shade

The term "cold frame" is often a misnomer, at this time of the year at all events. Usually when selecting a site for such useful contrivances regard is paid to a sheltered spot for winter requirements of plants, but when it is decided to locate them in a south position and they have to do duty for "housing" such things as Primulas and Cinerarias then trouble begins, as such plants dislike heat and the glare of the sun. It is well to utter a word of warning in a period when the thermometer is likely to soar as to the necessity of affording such plants a screen from the heat. Supposing the frame cannot be shifted to cooler quarters temporarily, then arrangements ought to be made to give shade. In the ordinary way under a sun-screened spot the light can be removed altogether for some weeks, so that these plants can have all the air it is possible to give them. It may not be quite so easy to dispense with the light in a south position and to give shade at the same time, as nothing must fall on either Primulas or Cinerarias that will crush or mar the leaves, hence the light ought to be "painted" with whiting or sun-cloud, but this of itself in a south aspect will not be enough. Coolness must be ensured by raising the sash and covering it over in the hottest part of the day with a mat. No plants become debilitated more than these two winter and early spring flowering greenhouse subjects in trying heat, and it behoves everyone growing them to afford cool and airy conditions, and, above all, in giving each plant room clear of its neighbour. MIDLANDER.

Ten Days in Leventina

The diary of a visit to the Alps of Val Ticino and around Piora

By HERBERT COWLEY, Editor of GARDENING ILLUSTRATED

(*Continued from page 532*)

WEDNESDAY, JULY 3RD.

SIGNS of activity at Hotel Piora. New arrivals include Swiss family from Zurich, comprising five children (German-speaking), and an Italian family from Milan (one child), English-speaking, all most friendly. The Italians are here for trout fishing, which is said to be very good in the streams below Lago Tom and Lago Cadagno.

Heavy mists surround the mountains. Spend a quiet day on easy slopes of Ritom and Cadagno amid true Alpine wildness.

On south side of Ritom the coarse-growing Gentiana punctata, with inflated greenish-yellow flowers heavily spotted black, replaces the better-known G. lutea. It likewise has a very long tap root. An equally coarse-growing Veratrum grows with Gentiana punctata. They appear to enjoy each other's company and are very common among large bushes of the Alpenrose and occasional plants of the tall-growing Achillea macrophylla.

On the grassy slopes of Ritom the vanilla-scented Nigritella nigra grows freely and the air is filled with its powerful and pleasing fragrance. Many flowers are at their best. That good plant Myosotis alpestris makes lovely patches of pure blue mingled with the less showy colours of Oxytropis sordida, Bellidiastrum Michelli, and Saxifraga cuneifolia. The little yellow Pansy, Viola biflora, abounds here. A little higher, among rocks, are brilliant patches of Silene acaulis so freely flowered that the cushion of foliage is hidden from view. How different to those luxuriant plants in rock gardens that make ever-spreading cushions of mossy green but fail to produce flowers. There are also large drifts of the white-flowering, low-growing Achillea moschata and Gypsophila repens. On one slope at least the narrow-leaved form of Ranunculus pyreneus, known as angustifolius, is plentiful, while the ground near melting snow is carpeted with the graceful Soldanellas pusilla and montana.

Returning in evening the Italian family are likewise well pleased with their day, having landed five trout.

THURSDAY, JULY 4TH.

Stormy and cloudy. The Italian family are in a fury. During the night the shepherd boys at Cadagno dammed the lake and so dried up the stream. Then, with their hands, they removed all the trout.

In other parts of Switzerland the offenders would be severely dealt with; not so in Ticino, which is a law unto itself.

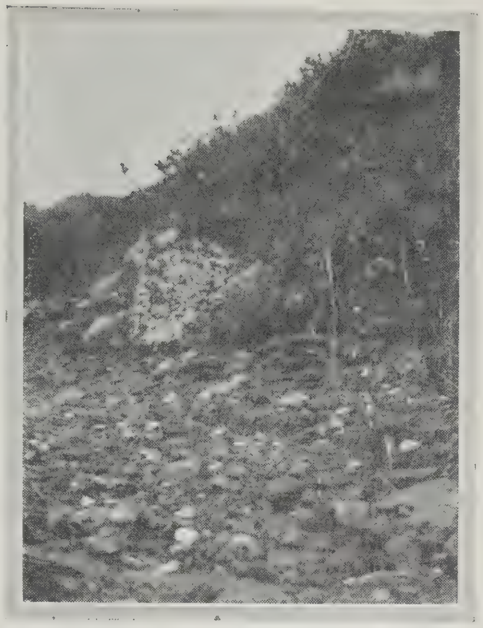
Flowers for naming

inability to determine names of sent for identification and con- disappointment to the sender is so e neglect of a few simple rules that be advisable and, indeed, imperative the reminder that it is necessary to them to obtain satisfactory results. wers should be cut in early morning ced in water for a time. They should the partially expanded bud stage or usses, as in the case of herbaceous s. When only a small proportion of s are expanded strap a little damp ound the stems and secure these to to avoid shifting about. The flowers should have some soft material between them and the box to prevent bruising. Despatch by first post [this office is closed on Saturday and Sunday.—ED.] to ensure quick transit. In the case of fruit, always send before the ripening stage is finally reached. This applies particularly to early Pears, Peaches, and Nectarines. The above may seem very simple instructions, and almost uncalled for, but the recipients of many hundreds of boxes in the course of a year, as in the case of a busy office, would doubtless notify as to the necessity for them.



In the centre of this picture is a patch of Silene acaulis, about a yard across, freely studded with rosy coloured flowers which it never produces in cultivation

Bulbs for early potting

Sometimes the one who attempts to force bulbs for the first time imagines that if he can have enough heat at his disposal the matter is quite easy; hence, one finds now and again amateurs, after potting bulbs about the middle of November, proceed a few weeks afterwards to bring them into extra warmth. One is within the truth to say that in such cases only failure results. There is no express culture in the production of flowers from bulbs, however good the soil may be, or however ample means of heat may be. There must in all cases be time given for root development before any thought should be given to bringing them into the excitement of extra warmth. Whether Hyacinths, Tulips, Narcissi, or some of the smaller flowered bulbs like Snowdrops, Scillas, and Grape Hyacinths are wanted for blooming indoors early, potting of them should take place in rotation. If one desires bloom in the neighbourhood of Christmas or the New Year, then a start should be made in August or early September, potting up in a compost of loam and leaf mould, and taking care that for six or eight weeks the pots are placed in a dark shed, but one where air can reach them, or put under ashes in a cold frame. Five-inch or 6-inch pots are a useful size, and bulbs may be planted quite close to each other. Not until root action has well advanced—easy to find out by examining one or two of the pots—should they be brought into heat; indeed the first shift should be into slightly warmer conditions, as it is not possible to jump bulbs into great heat from cool quarters, thinking they will come on quickly, without ill effects following. Many a batch of bulbs through this alone have turned out " blind buds." Gently luring bulbs into flower is in all cases better than extremes of temperature, and the next best thing is to give the bulbs a long season of growth so that when it is time to admit them to warmer conditions the pots will be full of roots and the bulbs well equipped.

WOODBASTWICK.

Trout streams above Lago Ritom and three disappointed anglers from Milan

Primula farinosa, Gentiana bavarica, and Dryas octopetala grow freely by these streams

Suitable Plants for Crazy Pavements

OBSERVATION of many houses and bungalows of comparatively recent erection indicates the growing popularity of small rock gardens and paved paths studded here and there with suitable dwarf-growing plants. The primary purpose of a footpath, of course, is indicated by its name, but a reasonably decorated walk proves a much more attractive and interesting feature in a garden than does an unbroken stretch of concrete. The amateur gardener who possesses just the average amount of land on which to spend his endeavours is not usually predisposed to be too lavish when allowing for paths, and consequently one guiding axiom should be, the narrower the path the smaller the occupants. Many plants for this sphere of gardening are available, and the following are selected for the benefit of the enthusiast undertaking the laying of crazy paving for the first time and who is as yet unfamiliar with many of these increasingly popular diminutive subjects. They are, for the most part, of easy culture, and should they prove too aggressive can easily be trimmed back without in any way injuring the remainder of the plant.

Saxifraga apiculata, a member of the cushion group of Saxifrages, blooms during March and April. It forms very compact tufts of bright green leaves and bears pale yellow flowers on stems 4 inches or 5 inches high. There is also a white variety which grows as freely and blooms as profusely as the original. Among the Mossy Saxifrages S. Flower Carpet is a variety with a very compact habit. During April and May its delightful pink flowers, borne on 2-inch stems, appear in such quantity that the rest of the plant is completely hidden. In common with most of the red and pink Saxifrages, however, the colour is impaired by strong sunlight, so to be seen at its best it requires a semi-shaded position. S. Stormonth, or Stormonth Seedling, is another good pink variety with dwarfer foliage, stems about an inch long, and smaller flowers, though produced just as freely. Of the two the latter, though a small and very dainty plant, spreads much more rapidly.

Armeria maritima, the native Sea Pink, is too well known to require description, and can be obtained with flowers of various shades of pink. There is also a white form. A much rarer kind, however, is A. cæspitosa, a minute species forming tufts of grass-like foliage about 2 inches high, with bright pink flowers. All the Thrifts revel in a well-drained sandy position in full sunshine.

The Aubrietias form another well-known class of plants indispensable for the present purpose. For the most part they seem indifferent to soil and aspect, though they flower earlier and perhaps a little better for a fair share of sunshine. When the flowering season is over it is essential to cut them well back in order to keep them compact and bushy. There are now many varieties to be had, and amongst the best of them are the following:—Dr. Mules, of very good habit, dark violet flowers; J. S. Baker, an early variety, large purple flowers with a neat white eye; Russell's Crimson; Gloriosa, large rose-coloured flowers; Mrs. Lloyd Edwards, deep violet; Delicata, pale lavender.

Arenaria Balearica is a plant very much at home in a damp and shady position. It not only covers the soil with its myriads of emerald-green leaves, but will actually grow upon the stone itself—sandstone for preference. It attains no appreciable height, but merely covers the ground with colour, and in summer bears the daintiest of small, star-shaped flowers on slender stems ½ inch high. A. cæspitosa aurea thrives well in a sunny position and covers the ground with a thick, Moss-like carpet of pale green. During summer it is studded with innumerable small white flowers.

Erinus is a very accommodating plant for a hot, dry position, and grows well in any odd chink on a path or between steps. It forms diminutive tufts of dark green leaves, and seldom becomes too aggressive. E. alpinus bears rose-purple flowers, alba being the white form and carmineus the carmine. All three are very desirable and attractive little plants.

Like the Saxifrages, Sedums offer a good selection of plants suitable for crazy paving. S. acre, the native Stonecrop, will thrive under almost any conditions, but the more sunshine it receives the better it seems to flower. S. acre aureum is a good variety with bright golden foliage and yellow flowers borne during June and July. S. anglicum is another native species similar to the last, but the flowers are rose-coloured.

Among the low-growing Phloxes, P. amœna is a beautiful dwarf variety of spreading habit covered in May and June with a rosy mantle. It is easily kept within prescribed limits by a little judicious trimming after passing out of flower. The sublata section offers many beautiful hybrids which are all of easy cultivation if guarded against excessive drought as experienced this year. The following are a few of the many good varieties which can be had:—The Bride, white; Vivid, a rich salmon-rose with a carmine centre, and one of the most outstanding of the group; Seraph, white with a blue eye; G. F. Wilson, blue-grey; Compacta, pink; Lilacina, pale lilac.

Thymus, serpyllum, the English Wild Thyme, is ideal for path-work. It exists in various forms, and a richly coloured kind is T. S. coccineus. This forms a close, green carpet except during the flowering period, when it is one mass of deep crimson-purple. Alba, the white variation, and Villosa, pale pink, are equally attractive. T. citriodorous aureus, the Golden Lemon Thyme, can be kept in the form of a neat 6-inch flowering bush by careful trimming, and is well worth growing for its fragrant foliage and bright colour. The same remarks apply equally to T. c. argenteus, the Silver Lemon Thyme.

Veronica Traherne forms a neat-growing tuft of golden foliage and is covered with clear blue flowers during June and July, reaching a height of about 6 inches. Another very useful plant in this family is V. repens, in some places known as Snow in Summer. This is a tiny creeping plant which spreads fairly rapidly and is covered with white flowers in May and June. V. rupestris, blue, and alba, the white form, are also of the creeping type. V. saxatilis grows about 3 inches high, making a dense carpet of blue flowers.

Two plants worth growing on account of their foliage are Achillea Kellereri and Antennaria tomentosa. The former has beautiful laciniated foliage of silver-grey and grows with a neat habit. The flowers, which appear from May onwards, are white and are held well aloft on graceful stems. There is nothing attractive about the flowers of Antennaria, but the small rosettes of leaves form a neat silvery carpet. Both plants will flourish in a hot, dry position.

There are many attractive plants among the dwarf Campanulas, but unfortunately some of them are rather fastidious in the matter of position and the soil they occupy. C. pusilla, however, is a reliable plant, and can be had with either blue or white flowers, which are very much in evidence during June
and July. C. muralis, with its de
flowers is also of strong constituti
somewhat larger than the foregoi
light soil and plenty of sunshine are t
cipal needs of the Campanulas. A.

Strawberries need a firm soil.

The advantage of having pot plants
there is no necessity to delay planting
count of the weather. If the soil is
may be necessary to still further con
it by treading. The distance betw
rows should be 2½ feet and 2 feet betw
plants in the row. In strong, rich soi
ever, some varieties with large folia
require 3 feet between the rows. F
and late varieties, I plant a foot apart
rows, and after the first crop every
plant is chopped out. Before planti
well over the pots and see that the soil
moist; in fact, I advise a thorough
ing some time beforehand.

After planting the ground around th
of the plants and between the rows sh
trodden firmly and afterwards hoed m

e surface, loosening it as little as

n the ground is firmed, the plants are s prone to run into foliage instead of ng up flower scapes. The ground must clear of weeds, all runners removed h appear, and the surface of the ground ntly stirred with the hoe. Water plays portant part in the subsequent treatment for the roots are quite unable to work y soil. Therefore, should the weather , the plants must have frequent and waterings.

dressing between the rows is very ial, as it keeps the ground moist and the plants nourishment. The manure put on in the autumn or spring, just h plants start into growth. I prefer to ion in autumn, as the enriching prinare washed down by the winter rains use the plants to start away with vigour in spring. About 1 inch of n traw should be laid down just as the are commencing to open. From the e flowers begin to open till the fruit p the plants must never suffer from the f water.

s oon as the fruit is all gathered, the tion must be thoroughly cleaned. e the top dressing, runners, and decayiage, so as to admit plenty of light and the heart of the plants. The ground then be lightly stirred with the fork, n every care not to disturb the roots. e dig between the rows with the spade, principal feeding roots would be del.

h length of time a plantation is allowed ain depends upon the nature of the nd the mode of treatment. My own e is to renew the plantation every ear, and I find that the best fruit is ed the second year after planting. r are now so many excellent varieties is a difficult matter to say which are st. The following I find very reliable od:—The Duke, a fine early sort, good cing; King George V., a grand variety, cious flavour; Hatfield Victor, very good cropper, and fine flavour; Royal eign, a grand variety in every way; and doo, a splendid late variety. F. H.

c Currants

soon as the fruits have been gathered the bushes with quassia and nicotine This will check the development of d, and cleanse the tips of the shoots of the multitude of aphis which has collected in them during the ripening period of the fruit. A good mulch of manure or litter will prove a boon to them if applied now.

Planting Vines and Peaches

(In Answer to a Correspondent.)

It is not advisable to make up the whole of the border for Vines at one time; the favourite practice is rather to do this piecemeal. A width of not more than 4 feet should be built up at first, loose bricks being excellent with which to form a wall to keep up the soil in front. They may be done without, and the turf so built that it will form a bank of itself; but the advantage of bricks is they keep the soil moist and help the roots that pass out to the extremities of the border. We have seen the roots protruding through bricks in great numbers when the vines have been long enough established to reach that extent. Good turf from a meadow is that required to form a permanent border, incorporating with it a goodly proportion of coarse bone, which not only affords lime to the soil by decay, but assists in keeping the materials porous. Lime should be employed also, but, if possible, this should be old or that obtained from buildings that have been pulled down. If you can procure some burnt refuse or burnt soil, this is excellent for border making. Drainage should be provided about 6 inches or 8 inches deep, and on this 2 feet of soil, and a pipe drain to carry off superfluous water. We have found, too, for forcing Vines it is best to provide against the roots going outside into the cold subsoil. This is done by concreting the bottom and the sides, if the walls are not good, for Vine roots will pass through even a solid wall to get outdoors. Some gardeners chop up their soil roughly, so as to mix all the ingredients well together; others simply arrange the Grass side downwards and apply other materials in sprinklings between the layers. The former is the better plan. If possible, try and procure soil from a source where trees grow well, otherwise your success may not be of the measure you expect or desire. Much depends on the soil in successful Grape growing. A distance of 3 feet apart provides sufficient space for a single Vine-rod, which means that you will require ten Vines to plant each house. For forcing you will find Black Hamburgh the best black Grape and Foster's Seedling a corresponding white variety. If you need more variety, you may include Madresfield Court, Black Muscat, Buckland Sweetwater, and Gros Maroc. In the later division Black Alicante, Lady Downe's, Gros Colman, Appley Towers, Lady Hutt, and White Tokay are good varieties, Lady Downe's and Gross Colman being the latest keepers. A Vine or two of Muscat of Alexandria may be tried in either house.

In making Peach borders care must be taken not to make them over rich; an excess in this direction means trouble later on, for the trees become so rampant in rich soil that it is impossible to get any satisfactory crops. We prefer, rather than employ new loam entirely, to use about half garden soil to mix with the turf. No manure should be employed, but some lime is absolutely essential, and also a few coarse bones. Turf that has been cut and stacked some time to reduce the herbage that is growing in it is best. If you cannot do this you may make your borders as early as you can, and allow them to stand some time before planting your trees and Vines. Allow about 10 feet run for each tree. For both Vines and Peaches it is important that the soil be made firm, but choose a dry time, so that the ramming-stick will not make the loam pasty. It should be in a medium state of moisture, neither dry nor wet. You need not concrete the bottom for Peaches, but provide some drainage the same as for Vines if the ground is heavy. You could make the border for Peaches all at one time, as root-pruning will correct any tendency to rambling. A selection of sorts for early, mid-season, and late will be found in Amsden June, Hale's Early, Grosse Mignonne, Bellegarde, Violet Hative, and Sea Eagle. Nectarines: Early Rivers, Lord Napier, Elruge, and Pine Apple. If your land is of a light or medium state and fairly deep, drainage would not be necessary for Peaches. If you need Peaches only, Stirling Castle, Dymond, Prince of Wales, and Barrington are other good varieties in addition to the above named.

Trimming Hedges

The cutting back of practically all kinds of hedges may now be taken in hand. Hollies, Lonicera nitida, White Thorn, Yew, Beech, Hornbeam, etc., may be cut in fairly hard without the slightest disfigurement, and will look as fresh as ever in quite a short time. Laurels are best when cut with a knife, otherwise many half leaves remain.

REMINDERS FOR THE WEEK

Southern and Midland

Rambler Roses

Many of these charming Roses have finished blooming for this year, and, wherever it is possible, should be thinned out in order that the strong, young shoots of the current year may be exposed fully to sunshine and air. The old growths which have borne flowers may, in many instances, be removed entirely, unless of a strong and vigorous constitution, when a portion of them only should be removed. It is, however, important to divert the strength of the Rose to the development of the younger wood, therefore do not crowd growth by leaving in an excess of old wood. Very often a Clematis or other climber accompanies the Rose, and where this is so the removal of the old flower-trusses is all that can safely be done, owing to the brittle nature of twining Clematis, many of which are now blooming.

Rhododendrons, Azaleas, Andromedas

These and similar shrubs must be watched carefully at this season and prevented from becoming dust-dry, as it is now that the handsome flowers for next year are being built up, and such plants remaining excessively dry over an extended period will fail to bloom next season. A good mulch of whatever is available at this season will benefit them immensely.

Lilies

The large groups of Lilies which are often planted among the above shrubs must be securely staked and tied as the large heads of bloom advance, and kept well supplied with moisture. The large auratum, tigrinum, and speciosum groups will also benefit from weak applications of manure-water.

Pinks and Carnations

Complete the propagation of Pinks by inserting the latest flowering kinds in boxes of sandy soil and placing them in a cool, closed frame, and do not overlook the importance of a new batch of any of the choice Alpine Dianthus at the same time, as these will strike freely under the same conditions and prove useful in replacing worn-out stocks on the rock garden.

The layering of Carnations in the open

This must also be completed if well-rooted plants are to be ready for the beds by the end of September or early October.

Seeds of Meconopsis Baileyi and others, Primulas, Auriculas, Ramondias, and Conandron

These will germinate freely if sown now and kept in a cool, closed frame where they are shaded from bright sunshine. Moist, but not excessively wet, conditions are essential. Seeds of Alpine plants will be found to germinate most satisfactorily, too, if sown now.

Peach houses

When all the fruit has been gathered, the ventilators should be thrown wide open and the trees exposed as much as possible in order that the wood may get thoroughly ripened. Abundance of water must be given and sharp syringings once daily. This will keep the trees clean and healthy. Trees carrying heavy crops in late houses and in the open must be syringed daily and assisted with weak applications of manure-water. Bud-dropping means disaster, and this will certainly arise if the trees are permitted to get unduly dry at any time during autumn and winter.

Perpetual fruiting and other Raspberries

Remove all the old canes from these immediately they have ceased to fruit, and thus divert the whole strength of the plants to the production of strong, young growth, which in the former case is already in bloom. A reasonable number of young growths only should be permitted to remain so as to average 1 foot apart in the rows.

Winter Lettuces

Make a sowing of hardy Winter White Cos, Bath black seeded and Trocadero, both for the filling of cold frames, pits, and to furnish plants for a good bed in the open.

Late Peas

These must be generously treated, liberal watering with an occasional application of liquid-manure being most essential, and in order to keep the dreaded Thrip, so troublesome to late Peas, at bay, the rows should be rosed over in the evening. Where birds are numerous it will be necessary to place nets over them. A good mulch of manure will prove of the utmost value to this important crop.

E. Markham.

East Grinstead, Sussex.

Scotland

Sowing Persian Cyclamens

The first half of August is now widely recognized as the best time for sowing the seeds of this valuable winter-flowering subject. Use clean, well-drained pans filled with a sweet, light compost; scatter the seeds thinly and evenly, and cover with about one-eighth of an inch of the soil. Give a gentle but thorough watering; cover each pan with a sheet of glass and a piece of paper. While some advocate placing the pans in a cold frame, I think as good or better results are had by placing in a pit, or greenhouse, where a little artificial warmth is provided.

Schizanthus

By sowing seeds within the next 10 days or so, very fine plants may be raised for flowering in spring and early summer. Sow thinly, in pans of light soil, set in a cold frame and shade until growth appears, which is generally in about 5 days. As soon as germination has taken place, raise the pans up quite close to the glass, for this plant is very easily "drawn," and where this happens, means farewell to any good plants. Prick off when ready and return to the frame, but as soon as frost threatens have the little plants placed on a light airy shelf in a greenhouse, from which frost is excluded. Water with great care, especially during the short days, and never be tempted to set in a high temperature.

Clarkia

This is an annual much favoured by many for early blooming in pots. Much the same treatment as advised above for the Schizanthus will suit this plant, but when pricking off three plants should be placed round the edges of 4-inch pots, instead of one in each of the 3-inch size, which suits the former. Very careful watering is necessary at all times, or damping off will soon wipe out the plants.

Mignonette

While the fragrance of Mignonette is acceptable at all seasons, it is in spring that it is most appreciated. Seeds should be sown now, either in pans, or in 3-inch pots. In the latter case, only three or four seeds should be put in each, and when the seedlings are growing freely, the weaker
be pulled out and one plant left in ea
When sown in pans the little plants
be carefully pricked into 3-inch pots,
they remain for the winter, and in Fe
are moved to the 5-inch or 6-inch siz

thinned where necessary. To prevent
age by autumn gales these young
should be loosely but securely fasten
the supports. Remove all weeds and
the whole plantation tidy.

Planting Strawberries

It is unfortunately the case that in
of our northern districts "runners"
produced so late in the season that it i
possible to plant in autumn, which is a
ous handicap, the first season being en
blank when the plants have to be se
in spring. Those who can secure st
well-rooted plants by the middle of Au
and set them out on rich, well-prep
ground, will be able to secure a crop of
berries next summer. The Strawberry
have a firm root-run; so if the ground
been recently dug it must be well tro
down before planting is carried out.

The name and address of the sender ired in addition to any designation he ire to be used in the paper. When more e query is sent, each should be on a piece of paper; the name and address lded to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

ORCHIDS

and other plants

rtance Tebbs).—If you are convinced t sprinkling of this artificial fertiliser stages has benefited your Orchids, o reason why you should not repeat ess, although we must confess to aving heard of this treatment before. do not name the Orchids we cannot and at what time they should be re- the kinds varying considerably in pect. Yes. A Bougainvillea will ll right in a well-drained tub, but a higher temperature than that of ary greenhouse. The tub need not than a foot deep, but must have 1-inch holes in the bottom to ensure rainage. The best compost for this best fibrous loam three parts, leaf- two parts, and one part coarse, clean As the various sections of the as require different treatment in the pruning, we would require to know es of your plants before we could Probably, however, dryness at the one of the main causes of the trouble, will be greatly aggravated by the pre- f the tree roots. Copious watering help matters even yet. It is difficult exactly what causes your Plum and ees to fail to set crops, seeing they abundance of blossom. Frost or nds while in flower, the fact that the s may be self-sterile, and the over- nce of the trees are all likely causes trouble. If the trees are trained on me temporary shelter while in flower most likely help greatly to ensure a . Fig trees while in growth require nce of water, but no manure, unless crop of fruit is setting and swelling, occasional soakings of weak liquid are very beneficial.

FLOWER GARDEN

onal flowers

hing Green).—We have carefully ex- your specimens of Geum Mrs. Brad- , and have failed to find any indication why the flowers should develop small eaves instead of the usual coloured s The specimens arrived at the office ry dried up condition, which made ation difficult, and if any animal ms had been present they probably e dried material in the post. It to us likely that some small crea- the Mite type may have caused the in the first place. We notice that stamens of the flowers appear to be njured or have turned into tiny leaves. ould like the opportunity of examin- cimens another season so soon as you anything abnormal about any of the . We think that it is too late to find ything this season, even if you send ecimens, because the injury occurred me ago and the organisms concerned w left. Thrips or Mites are the most cause of the trouble. When sending ens to this office please pack in a tin box, because when so packed specimens arrive in a nice condition for examination. We are sorry we cannot name the leaf of the plant you sent. If you will send a spray of the plant when in flower we will name it for you.

Dahlia blooms

("Earlstone," Newbury).—Doubtless the advanced state of the blooms when cut is responsible for their going to pieces during the night. When meant for exhibition the flowers should be a little less than fully open, for they will, as a rule, open out nicely after being cut and placed in water.

Mildew on Roses

(M. S.).—While we agree that mildew is one of the worst troubles the rosarian has to contend with, we do not think that it is impossible to check, or even prevent, it if a systematic course of Kuremil be given. This specific may be had from any nurseryman, and is not at all expensive, while full directions are given with each packet. Roses in draughty positions, or those planted against dry walls, are most subject to the disease.

GREENHOUSE

Nerines

("Bert").—The best time to re-pot Nerines is early in August, but this is one of the plants that only require to be moved once in every four or five years. Any loose outer skin may be removed, but there is no necessity to do this. The best compost for this plant is very fresh, fibrous loam, with a little leaf-mould and plenty of silver sand. Little or no water should be given until growth begins to show. You will understand that during winter the Nerine makes its growth, and, usually in May, the foliage begins to ripen, when water must be gradually withheld, and as soon as the foliage is dead not another drop of water must be given, while the pots should be set on the sunniest shelf in the greenhouse and well "baked" until the points of the flower-spike begin to peep from the bulb, when watering should again begin.

Amaryllis

Two years ago I bought a small collection of these bulbs, and on looking them over recently I found them very much invested with Mealy Bug. They were all treated with methylated spirit as they went out of flower, but the bugs do not appear to be strict prohibitionists, in fact, the bulbs so treated have produced still larger numbers of bugs. A friend of mine suggested the hot-water treatment used by Daffodil growers, but as he could not say he had had actual experience of the result of such treatment, I am afraid it would result in the death of the bulbs. There are many preparations advertised, I know, but few, if any, appear to have much effect on this pest except cyanide. This, however, is too dangerous, and therefore out of the question. On a close examination of a bulb it is evident the bugs get well down between the scales, and any outward application fails to reach them. Can you suggest any treatment short of burning the bulbs?—SIRIUS.

[We think that by periodically hunting for the bugs and touching every one found with spirit of wine that you would be able to get rid of the pests. We should not care to advise the hot-water treatment, but a solution of Gishurt Compound used slightly more than luke-warm would most certainly give some relief, if not an entire cure. Use while the bulbs are at rest.]

FRUIT

Melons

("Constant Reader").—Your Melon plants are suffering from stem rot, or canker, which is quite common when the plants have not been watered with sufficient care. While in growth the Melon demands abundance of water at the roots. This should not be poured close to the stem or the trouble you complain of is almost certain to appear. In planting Melons most good growers raise a small, rounded mound for each plant, and this plan is to be commended, as it prevents water lodging round the stems and yet permits of abundance of moisture reaching the roots. A small mound of three parts lime and one part ground charcoal heaped round the stem before the canker appears will usually prevent an attack.

Making a Strawberry bed

(S. A. C.).—Loam of a heavy texture should be well dug in and thoroughly incorporated with the staple. Such a dressing is better than applying quantities of manure. Heavy soils, on the other hand, are greatly benefited by being well manured, and the manure should be thoroughly decomposed. Another thing to be avoided when choosing a site for a Strawberry plantation is to ignore low, damp situations, for although the Strawberries may succeed in a season such as the present, in the generality of seasons they would fall a prey to mildew, and the fruit would rot in a wet time. The digging done, matters may be left alone until the plants are ready for setting out, and then the soil should be made quite firm by trampling it evenly all over previous to planting. This will thoroughly consolidate the soil and make a good firm bed for the plants to root into, and it will also in a great measure prevent the plants being thrown out or lifted by frost during the winter months. Some few hours before planting, the young plants should be well watered, and it is also a good plan to water them home directly the planting is completed. A trowel should be employed for setting out pot plants and pegged-down runners, and the soil must be made very firm about them. Runners taken from the plants without preparation may be dibbled in if time and labour are an object, but they should be made very firm or numbers will be lost during the winter.

White Currant "sport"

(E. M. Day).—It is possible that your White Currant produced a "sport." All plants seem to be able to do this at times, although we have never seen a currant of any colour doing so. All we can say is that the fact of your growing White Currants intermixed with Black Currants could have had no influence on the White Currant to make it produce a black bunch of fruit. Even if cross-fertilisation took place between a White and Black Currant, the colour of the fruit would not alter in the parent plant. The resulting seedlings might show variation in the colour of the fruits, but the colour of the fruit of the parent plant must always remain the same. If the Currant does the same thing again we should like the opportunity of examining a specimen of the branch bearing the bunch showing the variation.

Diseased Nectarine

(F. W. L.).—The specimen Nectarine is affected with Brown Rot, a disease which often causes much trouble amongst ripening Peaches and Nectarines. You should carefully collect and burn all the affected fruits the moment they can be detected. The growth you send is in perfect health, but when pruning keep a sharp look-out for any dead twigs or dead snags of tissue, because the fungus concerned frequently carries on from one season to another in such places. The most frequent cause of the disease is mummied fruits, which have been attacked the previous year, and which remain on, under, or near to the ripening fruits. Keep plenty of air on the house when the fruits are ripening.

VEGETABLES

Diseased Tomatoes

(E. C.).—Your Tomatoes are attacked by Buckeye Rot, which is caused by the fungus Phytophthora parasitica. This fungus is a frequent cause of a Foot Rot of Tomatoes, and also causes damage to the fruits later in the season. The spore organisms may be in the soil or in the water supply, and may reach the fruit from either. Spores are also produced from the diseased fruits, which alight on other fruits and so cause infection. Control measures consist in picking off and burning the affected fruits. A mulch of straw placed on the soil prevents water splashing up from the soil to the fruits and so carrying spores with it. A thorough soaking with a solution of Cheshunt Compound would help to control the fungus present in the soil, which is not only causing the fruit trouble now, but may also cause foot rot amongst your plants next season.

Tomato leaves for examination

(J. S.).—Incubation of the material sent has failed to produce a fungus that could in any way be responsible for the spotting of the foliage. We can, therefore, conclude that some cultural detail must be at fault. It occurs to us that the house getting so hot in the day is the probable cause. The temperature you mention—90 degs. F.—is, of course, not excessive, but much depends upon local conditions, *e.g.*, are you sure that the foliage is quite dry during the warmest part of the day, because sun shining upon spots of water is a frequent cause of Scald. During hot periods air should be freely given, and the house should be damped down, but moisture actually on the foliage during the day must be avoided. A crack of air should always be left on a Tomato house during the summer to prevent condensation of moisture upon the foliage. The soil you are top-dressing with is correct, but you might add just a little sulphate of ammonia —1 oz. to four plants would be ample. We are a little doubtful as to the watering you have given with kainit; " a handful " to a gallon of water is very vague; 4 ozs. to 5 ozs. could be held in the hand, in which case the solution would be too strong. In any case kainit is not usually given to Tomatoes. Sulphate of potash would be the better manure to employ, using 1 oz. to 4 gallons of water. It should only be necessary to give this about three times in any one growing season.

Broad Beans

(" West Somerset ").—We have carefully examined the Bean root-stocks sent, and while there are some slight signs that wireworms have been at work, not one of these pests was actually present, so that we could hardly place the trouble definitely to their charge. Growing this crop over a series of years on the same ground would cause much the same appearance. The specimens sent were much dried and shrivelled.

From Gardening Illustrated

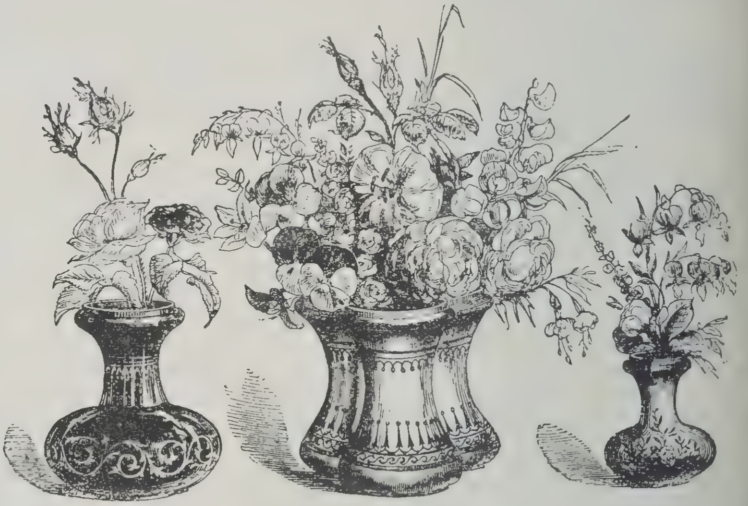
Fifty Years Ago

Pot plants in room

FEW floral ornaments look prettier in sitting-rooms than well-grown pot plants, which have a great advantage over cut flowers, inasmuch as they last longer in perfection. To townspeople who have no gardens or glasshouses they are a real boon. . . . Some conceal the pots in the following manner: A bundle of common Brake Fern is obtained and the ends of the Fern fronds, cut in a slanting direction with a sharp knife, and inserted in the

soil with which the pot is filled, cl
to the rim, over which they are brok
so as to make them droop and h
the pot. . . . All plants should be
moved to the greenhouse at night,
there is one; if not, into some room
which no gas has been burning. It

bad enough to keep plants in a ga
lighted room for any length of tim
but after the gas is turned out, th
should be removed, as the atmosph
being still charged with its fum
sadly injures them.



—August 9th, 18

Bottling vegetables

(Carnholme).—You can obtain an excellent book of directions on " How to Bottle " from G. Fowler, Lee, and Co., Ltd., 72, Queens Road, Reading, for 2s. 9d., post free.

MISCELLANEOUS

Pit refuse

(J. Scott).—We can hardly advise as to the size of pit for garden refuse, not knowing what quantity of such material you desire to collect and treat. Nor do we know the position of such a pit—whether on sloping ground, or on the level—which makes a great difference. All kinds of annual weeds, if these have not been permitted to seed, mowings from the lawns, rough grass, stems and leaves of vegetables, and the bulk of garden flowers, tree leaves, and, indeed, most kinds of soft vegetation will eventually rot down into useful material for applying to ground during winter, being almost as valuable as farmyard manure for many plants. To hasten decay, turn the whole mass once every three months, mixing it well together. House slops poured over the heap helps to hasten decay and also adds to the manurial value of the refuse. Omit all woody material, perennial weeds, and coal ashes. The two former can be burned and
added to the heap.

Lawn dressing

(A. J. C.).—The loam, wood-as
farmyard manure should all be
through a ¼-inch riddle and well mi
gether. The proportions should b
parts loam, one part manure, one par
ash. The poultry manure is very po
and if used at all must be at the
about a quarter part. This should ha
kept quite dry and rubbed through
riddle. A little soot will do no har
is not really essential. When applyi
dressing, scatter it thinly over the
lawn and well rub it into the turf
birch broom.

Various Galls

(J. P. Phillips).—The specimen
twig sent is affected with a small di
pest called Cecedomyia taxi. The
this insect lives in the end of Yew tw
produces a small Globe Artichoke
bunch of leaves. When fully fed t
pupates within the galls. The only
is to pick off and burn the affected p
The abnormal growth on the Box sp
is produced by a creature similar to,
the same as, Apple Sucker. This
very common on Box throughout the c
and if left uncontrolled will ruin the
of the bushes. Spraying with a goo
tine wash should control the pest if y
drive the spray well into the tips
growths. The galls on the Wild Thy
caused by a mite, but we have no
as to its life-history.

Good as ever!

NAMES OF PLANTS

M. Brierley.—The flower is that of Salsafy Tragopogon, a rather valuable winter vegetable, the roots of which are eaten. Mammoth Sandwich Island is an excellent variety for kitchen garden culture. The flowers, though fleeting, are handsome.

L. R. Barron.—Your specimens at first glance were somewhat puzzling, for, although undoubtedly Willows, the berry-like bodies needed explaining until closer examination revealed the fact that these bodies grew from the leaves, when no doubt remained that they were galls produced by one of the numerous gall wasps affecting Willows. If you care to dissect one or more of these bodies you will find that each one contains a larva or pupa which in time would become a perfect gall wasp. Both your specimens are forms of the variable Salix repens, the only one of the dwarf British Willows which is silvery-hairy on both surfaces of the leaves. The different conditions under which you found them growing are enough to cause the difference in size and vigour.

N. Barron, Shetland.—Without flowers we are unable to name your shrub with certainty, but it is one of the Ribes family, possibly Ribes sanguineum, and its flowering should only be a question of time. Do not prune it in any way until it has flowered.

T. Sewell.—The shrub is Cornus Mas. argentea variegata, and the best time to take cuttings of it is the second week in September, when they should be inserted in sandy soil or pure sand in a cool, closed frame. It is the variegated form of the Cornelian Cherry.

E. M. Tawney.—Cassinia fulvida syn. Diplopappus.

G.—The Roses arrived all smashed up, thus we find it almost impossible to name many of them with any degree of certainty. 6, Benedikt Roezl; 13, Félicité-et-Perpetue; 15, Ardon; 17, Dorothy Howarth; 18, La Reine Elizabeth; 19, Albertine; 23, Hugh Dickson; 25, Trier; 26, Non plus ultra; 27, Annie Crawford; 50, Fellemberg; 53, Mme. Isaac Perriere. Kindly read the rules for naming plants.

E. Pengilley.—Achillea Eupatorium.

H. Mills.—1, Santolina incana; 2, Lysimachia mummularia; 3, Coronilla cappadocica; 4, Erigeron Asa Gray.

T. J. Reed.—1, Spiræa callosa alba; 2, S. nobleana; 3, S. virginiana; 4, Lilium croceum.

Glasgow Reader.—1, Stachys lanata; 2, Isatis glauca; 3, Epilobium Dodonæi; 4, Sedum telephium purpureum.

M. E. Hamilton.—Digitalis lævigata.

Reginald Holloway.—The specimens sent were considerably wilted when they reached us, and it is therefore difficult to identify such. Probably, however, No. 1 is Allwoodii Lottie, and No. 2 Allwoodii Barbara.

SHORT REPLY

("Yonge," Westpark).—Certainly; both Paul's Scarlet Climber and Debutante are rambler Roses. If anyone calls this in question, refer them to the official list of Roses issued by the National Rose Society.

LATE REPLIES

Seedling Viola

(James Barker).—The Viola, of which several blooms were sent, would, if of good dwarf habit, be likely to become quite a good "bedder," although there are other named varieties of practically the same shade of pale blue or lavender. It would, therefore, have to be of neat habit and produce its blooms in great abundance, and that over a long period, for it to find favour with the flower-loving public.

Noteworthy plants

I wonder if any of your readers have grown what to me is a new Alpine, Lawrencia Bemella. I saw it at the Horticultural Show the other day, and it grows well with me. The way the flowers come from the side is most attractive, and it seems easy to grow so far. Lupinus Lyalli is also flowering well. It is not too hardy, but I hope a sheltered scree will suit it.

Godstone. N. S. C.

[The plant you refer to is Laurentia tenella, not Lawrencia Bemella. Laurentia is a small genus closely allied to Lobelia and Pratia, and three species only are known, one from America, one from Spain, and the plant you inquire about from Southern Europe. In Nature all three are bog-lovers and found most commonly on Sphagnum beds. None of the three are long-lived, but in suitable positions in the rock garden self-sown seedlings generally appear to take the place of the older, worn-out plants. As far as we know, only L. tenella is in cultivation, and is a very pretty, fairy-like plant with tiny rosettes from which arise a long succession of the dainty, China-blue flowers on short, thread-like stems. Lupinus Lyalli hails from Southern California and Mexico from no great elevation. This, too, is short-lived, and cannot be considered thoroughly hardy. It must be remembered that it hails from dry, sun-scorched hills with a dry winter climate, and that its silky, hairy leaves would hold too much moisture in our wet, changeable winters, and cause the death of the plants, which, under drier conditions, would probably survive our frosts with equanimity. We strongly advise that you save seeds of this delightful little Lupin and raise a succession from year to year.]

Yellow-flowered Tansy wanted

(E. M. Tawney).—Tanacetum argenteum, 1 foot; T. aucherianum, 1½ feet; T. grandiflorum, 1½ feet. All produce large yellow flowers and may be obtained from Messrs. J. Stormonth, Kirkbride, Cumberland, or Messrs. Bees, Ltd., Liverpool.

Schizanthus

("Cairndowan").—If you had omitted the stable manure from your compost for Schizanthus you would, we believe, have had better success. With this, our finest annual plant, the greatest trouble is in watering, the plant greatly resenting the soil being constantly saturated. We hope to have a detailed and practical article on the Schizanthus shortly in these columns, which please watch for, and which, we think, you will find useful.

Nectarines

(W. R.).—There must be some deposit from the water with which you syringe the Nectarine trees, or else you must be using some insecticide not suited to this purpose, although it may destroy the vermin. Keeping the house too close shut during the night and failing to open the ventilators early enough in the morning would also be likely to result in the rusty appearance complained of.

Viola cuttings

("Gardener").—The first half of September is the best time for inserting cuttings of Viola. A bed should be made in the frame some 4 inches deep, composed of about equal parts of loam and leaf-mould, and with a good amount of clean, sharp sand added, the whole being well mixed together and riddled. Before placing this compost in the frame, some rough material, such as the riddlings from the soil, should be laid in the bottom to a depth of 4 inches or so to ensure proper drainage, the prepared soil being placed over this and made moderately firm.
The cuttings are then dibbled in
inches apart, making certain that th

How do you buy
your BONEMEAL?

FOR immediate and complete assimilation by the roots of your flowers, fruit, and vegetable crops, you need a really pure bone meal; one guaranteed to contain no residue or added matter of any kind. Derrick's 100% pure bone is rich in phosphoric acid, phosphate, nitrogen, and lime; has all the constituents of a perfectly natural fertiliser, and no waste or slowly disintegrating matter. Unequalled for all horticultural purposes.

15/- per cwt. *carriage paid*

Friendships Made in the Garden

D a Rose of a favourite variety which ought so few knew that I was much rised to see a man opposite to me it when going to town last year. changed confidences on Roses in , and on this variety in particular. h loved a sort with solid petals and ragrance, a good, deep red which did blue, and we both found it in this, lford Crimson.

then we have often exchanged our experiences, and I have made a lifeiend by introducing my favourite climb- Hybrid Tea, which qually solid petals even more fruity ance. This, the enir de Claudius l, grows well, and twice in a season, st crop coming in nd the second at the August and early in ber. Neither my nor myself have ever at a Rose show, or d it in the cata- of many nursery- It is one of those l things on this or which, more than thing else, peer and may have common tion.

village I know, of course, everyone the other, came a r who kept himself self. A year after ival, however, there such a garden ed as the result of bours! His Del- ns excelled those of ctor's wife, who herself on her's, his Carnations d both earlier and later (they were al varieties) than those in the garden arson's wife, who had the best things Border Carnation world. He had, too, ngs in Pinks. In June his "White- ' were noted as superior to the Mrs. Sinkins. In glorious sequence, ple Forget-me-nots and Thrifts were d by Sweet Rockets and yellow n, associated with blue Aubrietias and tion of shrubs, which, commencing e Forsythia spectabilis, the yellow of which made the garden bright in and carried on with the numerous lphus (or "Mock Oranges"), commonly misnamed Syringas, which, of course, is the botanical name for the Lilac, of which he had also a collection in half-a-dozen shades.

This man knew shrubs, for summer found him with bushes garlanded with the joyous blossoms of Weigelas in pale and deep pink, also red varieties, that noble, sweet, and effective Spanish Broom (the Spartium junceum), which was quite a feature of his garden from May to October.

My Spartium did not bloom until July, so I had to make his acquaintance to find out his secret. I found him, as I expected, a charming exponent of the art of gardening. He said: "You prune your Spartium each year, of course. Come and see how I grow mine. I plant them in pairs. I prune one in winter the other in July in alternate years. The one I prune in winter does not bloom until July, while that which I prune in July, but leave unpruned in winter or early spring, commences to flower in spring."

Yes, there is art in gardening, as the Spartium shows so well, and whether in the garden or for cut flower in vases the Spartium junceum is one of the best of shrubs.

In Mr. G. G. Porter's rock garden at Belmont, Wantage, Berks.

The tall plant in front of Master Porter is a self-sown Chimney Campanula (Campanula pyramidalis)

Whether in making a new garden or improving an old one, it is a great thing to know what one wants and where to put it. This garden was made in a fruit-growing district where Apple-blossom, Pear, Plum, and Cherry made a picture which no genius of the landscape gardener can excel, and yet this man had the audacity to introduce several varieties of double-flowering Cherries, notably the Hisakura, varieties of flowering Crabs, such as John Downie, Dartmouth, and Veitch's Scarlet, the purple leaf Crab Eleyii, which carries its oblong purple fruits in profusion, and not least, the purple-flowered Prunus Blieriana, that also carries purplish-copper leaves so much alike to the better-known Prunus Pissardi.

There is no wonder that this man soon had many friends. Villagers regarded him with respect, and some, who had fine gardens, with friendly envy. He was a retired colonel who truly had turned his sword into a ploughshare, and that he was able to acquire such gardening knowledge, in spite of his more severe duties, is a mystery. By the side of his house, which is a farm bailiff's converted cottage, is a small paddock. He tells me he intends to make a Rose garden here, the anticipation of which gives him much pleasure. The house is already covered with Ivy, part of which next year he is removing to make room for Honeysuckle and Clematis. He will make more friends, will this colonel, when a lover of the beautiful passes by.

A. Swallow.

Crocus and early Daffodils

Crocus and early Daffodils for planting in the grass, by the margins of streams, beneath orchard trees, or by woodland walks for spring effects should be ordered now and planted immediately the ground will admit of its being done. Aconites, Snowdrops, Spanish and other Scillas, Anemones, such as Appenina, Robinsoniana, fulgens, and its many charming forms should not be overlooked for this purpose.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Rock gardens at Chelsea

My reply to "S. I. B." seems to have brought down on me an avalanche of epithets. I gather from the united efforts of Messrs. Ingwersen, Painton, and John Wood that I am "dogmatic, scathing, extreme, unkind, insincere, irresponsible"—all in the narrow limits of one little letter. How one learns!

Mr. John Wood is a sort of horticultural Lattimer among my critics. He has the effect of saying always "You are young, young man, very young."

There are one or two points which emerge clearly. Mr. Wood wants to know why I harp on one man's style. If I did, it was probably for the same reason that a man would pay little heed to lesser hills when a giant peak demanded his attention, or that a jeweller has scant notice for lesser jewels when a diamond of unusual lustre has got in among them.

The rock garden and torrent by Mr. G. G. Whitelegg at Chelsea this year, in which many Pyrenean plants were flowering

Mr. Wood may complain again of my superlatives, but superlatives are justified on occasion, and I think the occasion is here.

Again, Mr. Wood complains of the "flat and monotonous prettiness" of Mr. Whitelegg's exhibit. The impression I carried away was one of great and imposing height and of unusual boldness. It is strange, too, how the expressed opinions mentioned by him conflict with those I heard. I took the trouble to obtain verdicts from leading exhibitors, not rock workers, of lesser lights, and of private persons, and with one exception they declared Mr. Whitelegg's exhibit to be the outstanding feature of the rock bank. I have two large-sized photographs of the work in question before me as I write, and they confirm my first impression of unusual height and boldness, and tend to disprove Mr. Wood's charge of flatness.

I should like to ask Mr. Wood, too, whether rock gardens at Chelsea are not built with an eye rather to the near view than the distant. Mr. De Smet's work in a garden differs greatly from his Chelsea work, as the garden differs from the show.

Of the other two letters I have little complaint to make. They are both courteous in their tone and fair in spirit. I am acquainted with Mr. Ingwersen's views on rock gardens. He speaks always, though he disclaims it, from the plantsman's point of view first.

As to Mr. Painton, who thinks I am "unkind," I am sorry to incur his bad opinion. I am deliberately provocative with a view to drawing discussion, and my justification must be his invaluable contribution. The views of the ordinary reader and spectator, with no axe to grind, are always valuable.

He has unerringly placed his finger on the principal defect in Mr. Whitelegg's exhibit—overplanting. It is an ancient weakness to try to put all one's goods in the shop window. I hope Mr. Whitelegg will forgive the criticism.

I must apologise for running to such length, but my three doughty opponents are not to be dismissed in as many paragraphs.

Taplow. C. Penrose.

Ceanothus again

In travelling up and down the countryside of California, the wanderer is struck with the many different species of Ceanothus—Californian "Wild Lilac." In the mountains are clouds of the foamy bloom of C. integerrimus and the plume-like sprays of white (sometimes pale blue or pink) flowers never fail to give a buoyant uplifting feeling to the passer by, for they cover whole mountain sides with drifted snow. Higher still grows C. prostratus on slopes half shaded by Fir trees. This delightful little trailer forms a thick ground cover. The leaves are leathery and evergreen, and the bright blue flowers are followed by conspicuous three-horned scarlet fruits.

Upon the hills and lower mountains many other Ceanothi are found. One of tl
abundant is C. cuneatus, which fo
covers the dry, hot ridges and
valleys, where it forms extensive a
penetrable thickets. The bush i
barked, rigid and unyielding, the leav
and stiff, and the flowers white an
scented.

C. spinosus grows in profusion
mountains near the coast. It is a
straggling shrub, with yellowis
branches, and thin, light green leave
flowers are either pale blue or white
not so forbidding a shrub as its na
plies, for the spines are frequently
lacking.

In the redwood region of cent
northern coastal California, one

A shrubby Spiræa at its best

The Roses of 1929 in a Scottish garden

Last season I was sternly rebuked by a correspondent in these columns for daring to state that many varieties of Roses were affected considerably by the nature of the season, my critic ("J. R. K.") maintaining that a Rose was either good or bad, no matter what the climatic conditions were. This, at the time, I refused to endorse, and the present summer has more than proved that "J. R. K." was absurdly wrong, and that Roses that were magnificent under the cool and sunless conditions of 1928 are practical failures under the dry, sunny conditions of 1929. Last year both Ophelia and Mme. Butterfly were superb in form, size, and colour. This year they are about the most miserable looking flowers in the garden. Roselandia has been lovely this year, while in 1928 it was so poor that it was marked down for removal unless it was better another year. Lady Pirrie, one of the most lovely of all Roses in former years, is an absolute "wash-out" this year. These are but three examples, but they could be multiplied many times, and it will be interesting to know how it is possible to say that a Rose is either good or bad, let the season be what it likes. A long experience has shown me that very few varieties are unaffected by weather conditions. The only varieties here that can be said to do really well every season are Caroline Testout, General McArthur, Lady Roundway, W. E. Wallace, Wm. F. Dreer, Christine, Mrs. Henry Morse, Lady Elphinstone, and Covent Garden. All others are, more or less, affected by the climatic conditions. The best varieties this year, with a long spell of drought and with bright sunshine almost continuously during the first flowering season, have been Angele Pernet, Augustus Hartmann, Emma Wright, Etoile de Hollande, Frances Gaunt, Golden Gleam, Hortulanus Budde, Hugh Dickson, Lady Inchiquin, Lamia, Los Angeles, Mabel Morse, Mme. E. Herriot, Mrs. A. R. Barraclough, Mrs. Henry Bowles, Mrs. John Laing, Mrs. Wemyss Quin, Norman Lambert, Shot Silk, Sovereign, Scarlet Glory, Sun Star, William Korder, and Viscountess Folkestone. Good Roses that have been disappointing include Betty Uprichard, Charles P. Kilham, Clovelly, Colonel Oswald Fitzgerald, Dame Edith Helen, Golden Emblem, Gwyneth Jones, Lady Pirrie, Lieutenant Chauré, Mme. Butterfly, Mme. Melanie Soupert, Mme. Segond Weber, Marcia Stanhope, Miss C. E. Van Rossem, Mrs. Edward Powell, Ophelia, Padre, Pharisaer, and W. C. Gaunt. Many of these will, in all probability, give a good autumn display, as growth is fairly satisfactory, while the heavy rains during the last few days will help to cheer them on. Up till now (August 7th) mildew has been entirely absent, and until within the last fortnight Green Fly had never appeared. This latter, however, is now endeavouring to make up for lost time, and threatens, therefore, to be a bit of a nuisance.

Climbing Roses have, in nearly every case, been exceedingly fine. These include American Pillar, Climbing Caroline Testout, Climbing Mrs. W. J. Grant, Mme. Isaac Periere, Excelsa, Crimson Rambler, Dorothy Perkins, and Gruss an Teplitz. C. BLAIR.

Preston House Gardens, Linlithgow.

The "Mummy" Pea

Once again, and just the other day, I renewed my acquaintance with that old friend of my more innocent days, the Mummy Pea. The grower of this particular example of that venerable fraud told me exactly the same venerable yarn concerning his specimens—how the seed was found in the hand of a mummy of unknown antiquity, how the discoverer had given some of the seed to a friend, and how the friend had shared his treasure with the present grower. Very indignant was the latter when I told him that, although I implicitly believed in his good faith, both he and his friend had been the victims of an imposition. I have not the least doubt that seeds of Peas and of Wheat which have grown under cultivation have been found in the hands of mummies, but these seeds were placed there by unscrupulous persons for their own profit, and were not, as some even yet believe, placed there in remote ages. Such seeds may occasionally be found in mummy cases, and have been placed there originally, but their vitality is as extinct as that of the mummy. I believe that 30 years is the outside limit of the retention of vitality by Peas, or, indeed, of any seeds. But it is curious how the Mummy Pea myth persists. A. S. G.

Meconopsis aculeata

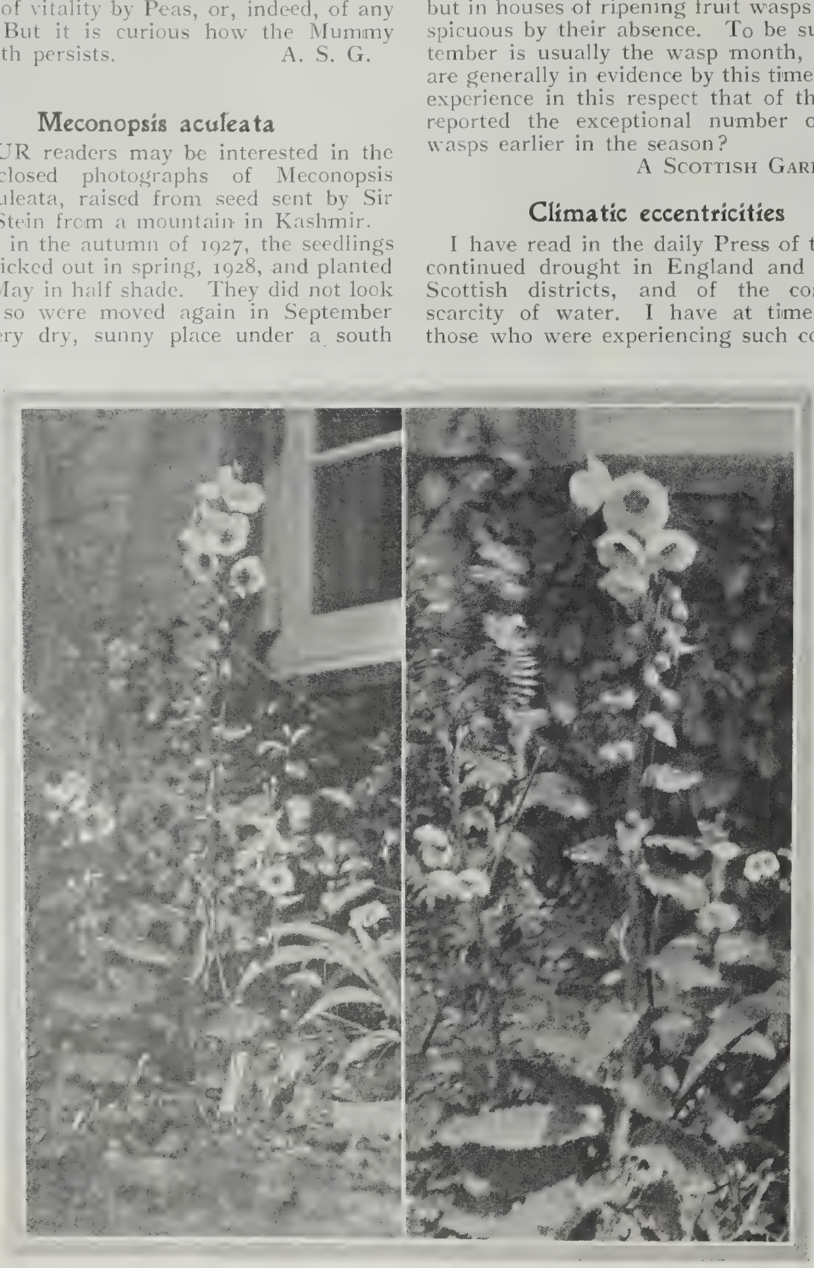
YOUR readers may be interested in the enclosed photographs of Meconopsis aculeata, raised from seed sent by Sir Amrel Stein from a mountain in Kashmir.

Sown in the autumn of 1927, the seedlings were pricked out in spring, 1928, and planted out in May in half shade. They did not look happy, so were moved again in September to a very dry, sunny place under a south window, where they have flowered all this summer. The finest had a stem 39 inches high, and besides the cluster of flowers at the top every leaflet has its accompanying bud all the way up the stem.

The flowers are extraordinarily beautiful, about 3 inches in diameter, a pale turquoise-blue, paler than Gentian Farreri, and of a wonderful translucent texture. The stamens are a brownish-purple, tipped with gold.

I. A. CRESWELL.

Ewhurst, Surrey.



Meconopsis aculeata, native of Kashmir

From photographs sent by Mrs. Creswell, Ewhurst, Surrey

Wasps

Like other contributors to GARDENING ILLUSTRATED, I was struck by the abnormal number of queen wasps during early spring. Not for many years have so many been seen or killed, and I was quite prepared for a plague of these dangerous insects at a later date. To my surprise I find that there are very few in evidence. I have only found two nests, and a vigilant outlook is kept for these, owing to the fact that the destruction of a nest means a florin to the discoverer and destroyer. It is, perhaps, too soon to halloo, but in houses of ripening fruit wasps are conspicuous by their absence. To be sure, September is usually the wasp month, but they are generally in evidence by this time. Is my experience in this respect that of those who reported the exceptional number of queen wasps earlier in the season?

A SCOTTISH GARDENER.

Climatic eccentricities

I have read in the daily Press of the long-continued drought in England and in some Scottish districts, and of the consequent scarcity of water. I have at times envied those who were experiencing such conditions when, in this neighbourhood, we have had a surfeit of rain day after day. For an example of this the following may suffice. I have a large area of short grass—lawns, etc.—with which to deal, and for years I have set Wednesday of each week apart for this purpose. By putting four machines to the work it is possible, with diligence, to complete the cutting on that day. Since the machines were put in commission in April only on one occasion has it been possible to cut the grass on the day appointed, owing to rain, and on no fewer than three occasions it was impossible to attend to the grass until Friday—that is, both Wednesday and Thursday, on these occasions, were hopelessly wet. I have given up trying to account for the vagaries of the weather, but of one thing I am sure, we in this neighbourhood need never, apparently, dread a water famine.

some two or three weeks ago, and the
r-spikes are opening up fast since the
it of rain. Those of the Primulinus section seem to revel in moisture, which is easily understood when we remember their place of origin. The most important point to bear in mind when planting Gladioli is to select sorts which have different flowering periods, then when any quantity is grown we can rely on having some flowers to cut from early in July until late in October. Among the first to open up this year were the following noteworthy Primulinus hybrids:—Golden Girl (pure yellow), Scarlet Banner (glowing scarlet, partially overlaid with crimson), Marion Cran (pale yellow, tinged rosy-carmine), Phyllis Kelway (creamy-yellow), and Mrs. James Kelway (white, with reddish-purple line on the inner segments).

Hardy Geraniums seemed to enjoy thoroughly the recent drought. G. grandiflorum has been a mass of blue for some weeks, and the purple-flowered armenum has been equally floriferous. Although these plants are good drought-resisters they appear to do equally well in wet seasons. A very pretty native is the Viper's Bugloss (Echium vulgare). The flowers open up a rich purple and change later to a dazzling blue. I do not often see this plant in gardens, but when planted in the mass it is very effective, and dry weather suits it well. Those who are looking for a good edging plant should make a note of this. Nepeta macrantha likewise looks well in the mass, and will stand the severest drought. The Salvia-shaped flowers are bluish-mauve.

A few days ago, amongst a collection of espalier Apple trees, I noticed some of them with sickly yellow foliage, whilst others growing on the same ground were quite healthy in appearance. The subsoil was a stiff clay, and the trees with the yellow foliage were grafted on the Paradise stock, whilst the healthy trees were on the Crab stock. The deduction is obvious. In the same garden were some fine old espalier Apples which were planted just over 100 years ago and which were bearing heavy crops of fruit. The longevity of the Apple is, of course, well known. In another garden I noticed some trees of Blenheim Orange with scarcely any fruit on them. I was told that the trees were severely pruned two years ago. I wonder if it is generally understood that this variety of Apple is much averse from pruning? When growth is too crowded the obvious plan is to remove some of the branches entirely. H. Greaves.

Helianthemum umbellatum

In general appearance this resembles a small-leaved Rosemary. It is one of the easiest plants to grow on a sun-baked spot in the rock garden or in wide fissures between two rocks closely packed with gritty loam. It grows about 1 foot high, is evergreen, and bears an endless succession of flowers in summer. The flowers are white, with a patch of yellow at the base of each petal, which adds considerably to their charm. In spite of the fluting character of the flowers they are effective for a short time and are succeeded by a similar crop next day.

The plant thrives in the sunniest position in a soil of moderate quality and is easily increased by cuttings. It is advisable to grow the plants on in pots for the first year in arid quarters in a cold frame, ultimately plunging in ashes in the open air. Transfer to permanent quarters in autumn or spring.

H. Stevens.

Notes from a Cornish Garden

A GROUP of Primula anisodora, one of the later flowers, is now in bloom. Of the Candelabra section, it grows 2 feet to 3 feet high, and has three or four whorls of dark, velvety crimson flowers, some 15 to a whorl, on the tall green stem. The bells are not very large, and though they have a yellow eye, do not display it, as they hang down. It is not so showy as most of the series, and to get its full effect should be planted where one can look up at it, and this is difficult unless one has a stream descending from a height over a waterfall, as it is a bog plant. Mr. Darnell says that it is best treated as a biennial, for it produces abundant seed, and often dies after flowering.

The Royal Horticultural Society sent me last year two plants of Mr. Comber's collecting in the Andes. One of these is apparently Calceolaria Penthamii, which has rugose leaves and a few small, yellow flowers on slender stems. My plant is still in a pot, for I do not know how hardy it is. The other is most likely Adesnia muricata, a small sub-shrub with pinnate leaves and clusters of yellow pea flowers lined with red. It has only previously been reported from Patagonia, and in the absence of fruit cannot be accurately determined. A pretty little plant which seems to like a dry place in the sun.

The later Rhododendrons are good this year. R. crassum has been generous with its white, scented flowers, and the one plant of R. Wasonii, a low-growing, sturdy, spreading bush bought long ago at Coombe Wood, has excelled itself. The flowers are violet-rose with a dense crimson spotting on the upper lobes, and the leaves stiff and leathery, with a thick cinnamon tomentum on their lower surface. The bush is about 6 feet across and 30 inches high.

The small-growing orange R. apodectum and the orange form of R. dichroanthum, which does not grow as tall as the pink form, have likewise bloomed well. Of the high Alpines R. salignum, introduced from Sikkim by Sir Joseph Hooker, is showing its dull yellow flowers. Interesting and rare as it is, it is not particularly striking, and is only likely to be met with in collections. Another dwarf shrub is R. obovatum, of the lepidotum series, the small flowers of which are dark crimson.

Then there is R. Griersonianum, of a peculiar shade of red, approaching to salmon-scarlet, and described by Forrest as geranium-red. It is a very beautiful plant, with soft lanceolate leaves covered with short hairs, but is not well satisfied with its place here, some plants being in too dry a spot, and others, perhaps, are too much shaded.

Lastly, there are R. eriogynum and R. facetum, which appear to be the same thing, and have truly magnificent dark, fleshy-red flowers in big round trusses. But, alas! they are both somewhat tender, and will hardly succeed save in the warmer counties.

Still, they and R. Griersonianum may give us some colour in the late-flowering hybrids. Of these, R. Souliei x discolor has just opened its first and only flower. It is pink in bud, fading to white, with a larg son blotch at the base, and flowers truss 3 inches by 4½ inches, seven openly campanulate, and should acquisition when it develops.

Magnolia parviflora has bloomed w round, white flowers with crimson s being a pretty sight, and one hopes th hot, dry summer may induce it to ripe of its curved pink fruits, the seeds of should be sown as soon as ripe, a vitality is short. A seedling M. ro

Above: **Rhododendron Tyermannii, a tender species with large white flowers**

which was planted out in May in go with a mulching of leaves, is makin growth and evidently appreciates its from a pot. If all is well, M. Nichols is to go not far from it in the autum that particular spot has 3 feet to 4 good loam, shelter, and plenty of sun.

Rosa Moyesii has flowered well, b plant has lost all its leaves, whilst a ese Cherry given me by Mr. Farr planted near it is dead, which looks the roots of both had got down to som deleterious, for the drought here has n sufficient to cause decease.

Not far off Rosa macrophylla is fl ing, and R. pteracantha, which ha cut to the ground, is sending out long beset with broad based red prickles, are its chief beauty, and which lose colour as the branches become mature

During the winter I picked some p the Australian Bluebell Creeper, heterophylla, from a plant apparentl by the frost. The seeds germinated didly, and I have been able to prick box for this garden and send the bala the Royal Horticultural Society for di tion. "Peter the Herm

Lilium candidum

Obtain and plant on well-prepared b heavily manured ground the lovely Ma choosing a sunny position and one sh from cutting winds. Before plantin damp the bulbs, and, whilst wet, roll in sulphur. Plant so that the crown bulb is about 3 inches beneath the s and use a fair quantity of old lime-ru the soil.

Aubrietias

er propagation for next spring's beauty

not only to the owner of a rock garat Aubrietias are looked upon as indispensable in the spring display, to those who have rockeries, rough nd banks about their gardens, where plants in their season bring such sheets of colour. Unfortunately, k upon the time immediately they ased to bloom as being the best for ttings of one's own stock, or in a sowing of seed with the object of ther varieties. As a rule, most of rd spring and autumn as the two opagating seasons, and overlook the t just after Aubrietias have bloomed take cuttings and be assured that, re, they will take root. This is better erring the matter until early autumn, here is often more risk in cuttings out of doors. Just now there is an upply of shoots on old plants, and it all to the good if some of them are away. They will root quite easily out rs in ordinary garden soil, provided, it be heavy, some coarse sand is mixed and the cuttings are shaded for about or so, and not allowed to flag for f water. It may be found more conto strike cuttings in pans or boxes the open ground, and those about s deep will be suitable. In taking s cut them off near a joint. The old ill then break out afresh. A sowing l can also be made now in pans, them in a cold frame. When large to shift they should be pricked off her pans or planted out into the posithey are designed to fill. Where ias are wanted to grow in a rough ten the most success follows sowing the niches in sandy loam. They grow better than when young plants pt in later, the roots of seedlings findir way into small spaces and growing n cramped environment.

LEAHURST.

Fritillaria imperialis

illaria imperialis, or the Crown Imhs it is still called in many gardens, is, as, the oldest, and is certainly one of y best, of the family. It is the gay te of cottage gardens, and is one of blest and most brilliant of the genus. ccess achieved with this flower in such es is due in a large measure to the fact e bulbs are allowed to remain unred for a number of years. It deeply disturbance, and it is only from wellhed examples that the full beauty of ssoms is revealed.

ls should be planted in autumn. They curious, rugged outline, with a deep in the centre on the top side. A very t and not altogether pleasant smell is aracteristic, but happily this is not itted to the flowers. Owing to their atively large size the bulbs ought to ted not less than 5 inches deep and in lonies, allowing about 1 foot between bs. Where the soil is heavy and wet lvisable to surround them with some sand or ashes, and in any circumit is necessary to plant them on their . If planted upright the cavity previeferred to becomes filled with water frequent source of decay.

llaria imperialis is an excellent border nd suitable for all soils. It begins to in April and lasts for many weeks in on. The only fault I can find with oble plants is their untidy appearance in summer, but this may be remedied by planting them in close proximity to some late-flowering subject and so fill the hiatus that would otherwise occur. Few plants are better for picturesque groupings in the pleasure ground or the woodland. With a fairly open space and with deep, rich soil it forms handsome groups.

To my mind these plants never show their full beauty in the border. They ask for the surroundings of the woodland and, with these conditions, are delightful. This Fritillary may now be had in a number of orange, red, and yellow shades.

H. STEVENS.

A contrast in Magnolias

FEW flowers furnish such a contrast in any two varieties as Magnolias macrophylla and fuscata—the one a hardy or semi-hardy tree with larger flowers and foliage than any other tree in English gardens, and the other a greenhouse plant with small foliage and small, insignificant flowers, emitting a strong but delightful perfume. Indeed, so strong is this perfume that the presence of one half-expanded flower will be quite noticeable at some distance from the house in which it is grown. The only hardy plant I know producing a flower at all like its perfume (in a minor degree) is the Allspice shrub, Calycanthus floridus. M. fuscata is a native of China, from whence it was introduced many years ago, but is not often seen in gardens. It is of slow growth until it is established, when it produces its thin shoots freely, but never growing what one would call luxuriously, and I have never known it to flower very freely. However, to those who like a flower for the sake of its perfume, it is well worth a small space on the back wall of a greenhouse or as a pot plant if a wall is not available. A mixture of turfy loam peat with a little sand will be found a suitable compost. With respect to macrophylla, with its very large flowers and foliage, I cannot say it looks very happy in its surroundings in an English pleasure-ground, and seems as if it would be more at home in a place like the temperate house at Kew. On the very rare occasions I have seen it outside it has been in a shady position, where possibly the wood was not ripened thoroughly, as the flowers were only produced very sparingly. Another deciduous member of the family, Magnolia acuminata, a native of the Northern United States, where it is, I believe, known as the Cucumber tree, grows into quite a tall, shapely tree in England, occasional specimens being over 40 feet high.

Magnolia parvifolia
Round white flowers with crimson stamens

Lifting and potting Chrysanthemums for indoor blooming

It has become a common practice among amateurs who grow Chrysanthemums for the supply of cut flowers in late autumn to bed the plants out for the summer and then in the autumn lift and put them in boxes or stand them on the floor of the greenhouse, placing soil round them. This practice has its good points, in that it saves the use of large pots, and, what is perhaps important to one with little room at his disposal, enables more plants to be got under cover. It is unwise, however, to dig up plants and put them straight in the greenhouse, as to do so generally results in the loss of many of the lower leaves and a temporary collapse of some. For a few days before removal is effected each plant should be partly raised with a spade. This will give it a temporary check, but otherwise will not injure it, and where the roots have to be cramped into a confined space, as in a pot or box, it will be found better than attempting to lift plants bodily with all the roots attached. It will depend on the weather and locality when such removal from open ground to greenhouse should be made. In a very mild autumn one is sometimes safe in waiting until nearly the end of September, but in others the middle of the month should see the work done. Where Chrysanthemums have not been properly staked in the ground great care needs to be taken in lifting them, otherwise it is an easy matter to break shoots in the lifting. It will pay to stake them as far as possible, even at this early date, before attempting to lift from the ground. It may be necessary to shade the house for a few days after the change has been made and to water rather more liberally, but at the same time ventilation must be given both day and night.

LEAHURST.

Saponarias

There are few plants of a trailing habit that are easier to grow or give a more bountiful display of bloom in so short a time as the Saponarias. I wonder sometimes why those who have old stone walls about their gardens, or rough banks, do not make more use of them. Not many plants about a rock garden get into their stride quicker, once rooting has taken place. Here is a note about two plants which are growing in my garden. Took cuttings in July, 1927. Planted in permanent quarters in spring, 1928. Commenced to bloom in June. This year they are 4 feet across, with thousands of blooms. The only difficulty about them is to restrain them by cutting after they have ceased to flower. Saponarias will grow in any ordinary garden soil, but like one in which sand is found. S. ocymoides—the one alluded to—has bright rosy pink flowers, which spring from narrow, deep green leaves. I write this note to advise anyone who may have plants which have flowered to cut away at once the spent seed pods, and so give the plants a chance of getting light and air. There are plenty of cuttings to be had on flowered-out plants, and if these are inserted in pots of sandy soil, kept moist and shaded, they will not be very long in rooting. Such cuttings will start blooming next year. They can be planted in final quarters either in October or spring.

W. F.

A bouquet of Everlasting Flowers

For winter decoration when fresh flowers have to be purchased by those who have no greenhouses there are some plants easy enough to grow in the garden that give us blossoms which, owing to their dried character, we call "everlastings." Some of them are perennial and quite hardy, among them being Statice, with broad, spreading panicles; Echinops, or Globe Thistles; Eryngiums, known as Sea Hollies; Physalises, with orange and red pods; also Catananches, or Cupidones, which yield blue flowers. One plant among biennials is a favourite with many, as it is not without value as a garden flower, but is accounted more because of its silvery pods, which enclose the seed—it is Honesty. Two very pretty annuals which can be grown in any sunny garden in quite ordinary soil are Helichrysums and Acrocliniums. The flowers are Daisy-like in build. All everlasting flowers mentioned, except Physalises and Honesty, should be gathered when half-expanded and dried, as afterwards they expand a little. Bunched together and arranged with a few grasses or Bracken one may contrive a bouquet that is better than an empty vase and serves to remind us of summer beauty in our garden.

MIDLANDER.

Asarum europæum

It seems strange that so useful a plant as Asarabacea should be so seldom seen in gardens, for nothing can be better where a low-growing plant of neatest habit is desired. The flower is of no importance; greenish, of no beauty, and hidden deep down under the leaves. The use of the plant is for its neat masses of brightly polished, deep green leaves, in shape much like that of Cyclamen. In light soils it is especially useful, and is only too willing to grow, for it quickly expands into its sheets of brightly shining foliage. It is best in shade or half-shade. It is a pleasant plant to handle, for it gives off a good scent something like the spiciest part of the smell of pepper. Planting in joints of stone paving and steps has been sometimes overdone, but when the right plant comes in the right place it may have a happy effect, as when the Asarum in the picture came of its own accord at the foot of a stone-built box that holds a ball-trimmed bush of Box.

Asarum europæum

FRUIT GARDEN

Feeding fruit trees

In the cultivation of fruit, feeding is of great importance, particularly with regard to regularity in bearing. When a tree reaches bearing age and is well furnished with fruit spurs there are only three causes that can prevent it from bearing a crop of fruit in any season. The first, of course, is unfavourable weather when the trees are in bloom, the second is insect pests or disease, and the third insufficient nourishment. Provided the tree escapes the first two, what is there but lack of vigour that can prevent it from carrying a crop to maturity?

Among gardeners one often hears the remark: "The trees bore well last year, but this season they have missed." This is simply because the heavy cropping has been a great strain on the trees, leaving them with insufficient vigour to form and perfect the fruit-buds for next year's crop. The result is a season's rest from fruit-bearing to form more fruit-buds. Those who study the matter thoroughly find that fruit-buds form early in the season; in fact, about three weeks or a month after the fall of the bloom. If the tree has sufficient vigour those buds are fed by the tree in autumn; that is to say, they are "plumped up" for fruiting. Therefore a tree carrying a heavy crop needs assistance in early autumn to enable it to perfect its fruit-buds.

For some years now feeding has been my practice, with satisfactory results, but I must confess that not in every case has the biennial cropping been overcome. The right time to feed trees bearing a heavy crop is through August and the first part of September. I favour a quick-acting fertiliser, one that supplies three of the essential plant foods—ammonia or nitrogen, potash, and phosphates. A good guano answers well, as do also many of the good general fertilisers. Last autumn, I used a fertiliser containing 5 per cent. ammonia, 24 per cent. total phosphates, about 7 per cent. soluble in water, and 7 per cent. potash. About ¾ oz. was
given to each square yard, the dress
reaching beyond the spread of the br

ornellison, the old and well-known
hite, is one that may be so treated,
sult is far superior to anything that
starting the plants under glass and
ng them in the open air. In fact,
pends upon all the growth being
the open air, and that is why the
in cottage gardens previously
are so good, for, when growth starts, the cottager has no glass convenience to bring the plants on, but he has to find a sheltered spot—perhaps the sunny side of the house, or some other nook—where the plants make a slow but steady start, and lay a good foundation upon which, when planted out, they will build up their mounds of blossom. We have also some other greenhouse Fuchsias that were put in a border last year and left throughout the winter, not being wanted. Upon going in the spring to dig them up, thinking them quite dead, as, indeed, all the wood was, I found vigorous shoots starting from the roots, some of them as thick as my little finger. Of course, I then left the plants alone, and the healthy growth which has been made since, with the profuseness of fine flowers, is as surprising and convincing as it is beautiful.

As the Fuchsias have the great and most desirable merit of lasting in beauty the whole season through, it follows that they are capable of playing an important part in flower garden arrangements, both of a permanent and temporary character. The essentially hardy kinds can be devoted to a variety of permanent uses. Fine specimens like the one before mentioned are desirable, also bold groups in association with shrubs or vigorous hardy plants. Where hedges of an informal character are desired, nothing could be more beautiful than one formed with Fuchsias. F. gracilis makes a regular, but graceful summer hedge, whilst F. globosa will make a permanent one. Another way in which I have seen this last-named kind effectively used is to train the leading shoots to the wall, and the little branches then depend in a graceful and charming manner; but they should be pruned hard back each year, and as the main shoots gather strength with age, these wall Fuchsias become conspicuously beautiful objects. The larger-flowered greenhouse Fuchsias would, if more freely used in the temporary or summer floral arrangements, do much towards increasing variety, interest, and beauty, and their graceful and fine form, whether as bush, pyramid, or standard, would diversify and relieve the flatness and monotony of the beds and the flower garden generally. One thing in respect to these last should be ever borne in mind, and that is, to let them make their growth in the open air, and they might with advantage be planted in their intended position much earlier than the tenderer things with which they are to be afterwards associated. A. H.

Fuchsia Ballet Girl

A new disease of Campanula pusilla

Growers of Campanulas whose plants of C. pusilla (or Bellardi) are now passing out of flower may be well advised to give their last blooms a keen scrutiny to see if any of them show within the corolla the tell-tale black spores of Peronospora corollæ, a fungus which, as far as the writer is aware, has not previously been recorded in Britain. It has been detected here on both C. pusilla and its white variety alba, and is doubtlessly able to infect the others like Miranda and purpurea. It appears to perenniate within the rootstock of its host, but gives no outward sign of its presence till the plant begins flowering. Then many of the buds fail to develop properly, some remaining pinched and shut, while those which expand are ugly and malformed. Examined carefully, they are found to be specked inside with numerous minute conidia of oval outline which arise from filaments passing back through the tissue of the corolla to the ovary wall. These infected flowers do not as a rule set seed, but a few open widely enough to allow the visits of insects, which, passing from plant to plant, may spread the disease. This remains to be proved. Badly infested flowers often bear spores on the outside as well as on the inside of the corolla, though none can be found elsewhere. This distortion of the flowers excepted, Peronospora corollæ inflicts little damage of any note, affected plants growing as vigorously as sound ones, although the grower is cheated of his proper reward. It is not easy at the moment to suggest any measures of prevention or cure other than the common-sense one of scrapping and burning every plant on which the fungus makes its appearance. Luckily Campanula pusilla is cheap and may be easily replaced should such a drastic procedure become necessary. W. T. STEARN.

Ten Days in Leventina

The diary of a visit to the Alps of Val Ticino and around Piora

By HERBERT COWLEY, Editor of GARDENING ILLUSTRATED

(*Continued from page 548*)

THURSDAY, JULY 5TH.

HEAVY mists and ominous clouds mark the approach of stormy weather. Rain comes from the direction of St. Gotthard.

Small children with very large umbrellas bring a herd of cows and calves down the slopes to the shelters at Cadagno.

The cattle look fine on the sky-line and as they cross in front of the cascade. There are good pictures to be made here, and I arrange camera in readiness for the moving herd, but the light is not good, and I spend much time in an endeavour to secure a good snap. A young bull, little more than half-grown, eyes me with suspicion. He strongly disapproves, lowers his head, straightens his tail, and charges down the slope. I pick up camera and dodge behind a rock. The bull rejoins the herd. Later I discover that I have made two exposures on one film.

Shepherd boy with load on the track to Santa Maria

The most beautiful flower seen to-day is Anemone sulphurea (or should it be sulfurea?). Was ever a flower lovelier or more fittingly named than this? Of all the floral treasures in the high pastures of Piora surely this is the most beautiful. I have tried to think of other living things of the same luminous quality as A. sulphurea, but can recall nothing of just the same tone of colour. It reminds me of Œnothera in soft evening light, or a brimstone butterfly on a June morning.

I found one pure white form in a colony of Anemone sulphurea. The pure white is Anemone alpina, a calcareous species, while the sulphur-flowered species belongs to the granitic and siliceous formations, such as we have around Piora.

Four men are working on the slopes of Fongio making a track. Is this the beginning of a larger road of which we have heard rumours? A road is in contemplation from Santa Maria to Airola which would pass round Lago Ritom, and the proposal is to make a village where Hotel Piora now stands. It is said that the slopes between Piora and Airola are too steep for road-making. Let us hope it is so, for a road would spoil the charm and peace of this delightful spot.

I overtake a shepherd boy coming down from Cadagno. He is carrying a
heavy for such young shoulders. Th
these youngsters carry is surprising
an intelligent boy and I am interest

Irreconcilable Alpines

IN the days long ago, when mountains were visited but seldom and avoided whenever possible, it was assumed that the plants from those remote, unfamiliar heights would hardly consent to grow in lowlands gardens, although, as a matter of fact, the Alpine Auricula and a form of Gentiana acaulis were well established in cultivation in the days of Queen Elizabeth.

Nowadays our attitude is very different, and perhaps we tend to swing over to the opposite extreme and to expect any Alpine to grow for us as soon as we have built for it a rock garden that recalls (for us at least) the pleasantest features of its natural habitat. But the problem of cultivation is not so easily solved. We may build a miniature Mont Blanc, tether a nanny goat on its lower slopes, and teach the garden boy to yodel, but not by these means shall we succeed in disguising from Eritrichium nanum the fact that it is being asked to grow in England. Eritrichium is an extreme example, but it is interesting, though it may not tempt us, as the most notoriously intransigeant of the high Alpines, for it will not flourish even in the cold greenhouse, where it can be ensured the long, dry, dormant season in winter, which will reconcile most Alpines to cultivation. There is no quite obvious explanation of the difficulty in growing this plant. It has no particular affection for high altitudes since it grows almost within reach of the waves at Spitzbergen, nor is it the last species of a dying race, for it has, I believe, a great many weedy and undesirable relations in the lowlands. Of course, it is not impossible to grow it, and from time to time determined specialists woo it into flower and rush it off to Vincent Square, where it usually dies on the show bench from the humiliation of being mistaken for an undersized Forget-me-not.

I suppose we must learn from these Alpines that the successful cultivation of a highly specialised plant does not depend upon the extent to which we reproduce its natural surroundings, for a highly specialised plant may be difficult in cultivation, not because it lacks the conditions to which it is specialised, but because its specialisation lays it open to injury in the environment in which we are trying to grow it. I have seen scree plants growing in pure, chopped Sphagnum in the moist air of Cumberland without a stone within reach of their long rootlets. And we may notice that Genista radiata, which has adapted itself to the long summer drought of Dalmatia by dropping all its leaves at the end of spring, still continues to take this precaution here, but is quite indifferent to the wetness of our summers, in spite of the high degree of its specialisation.

Many of the high Alpines wear a fluffy covering of hairs, which serves, presumably, to maintain an air space between the leaves and the surrounding snow in winter, and such plants are notoriously liable to suffer from our wet winters. But fluffiness in itself does not seem to expose a plant to injury from the damp, for one of the woolliest plants in the garden, that vigorous, handsome weed, Lamb's Ears (Stachys lanata), which protects itself against the heat and drought of the Persian mountains with a woolly burnous, does not mind being soaked and bedraggled for months on end. On the whole, it is tempting to think that it is not fluffiness that makes certain Alpines intolerant of our winters, but some other factor, such, we might suppose, as a thinness and delicacy of the leaves beneath the woolly covering, for it is noticeable that high Alpines which are not so protected usually have tough and waterproof leaves.

It is not only the high Alpines which do

not take readily to cultivation (many of them, indeed, are quite easy), for an even more obstinate reluctance is encountered among our own native Alpines. One of them, the Cloud Berry (Rubus Chamæmorus), is said to be quite intractable in the garden. I do not know how far this is true, for it is not a plant likely to evoke very persistent attempts to cultivate it, but I do know that I have always failed with it myself, and have never tasted in this country its deep yellow Raspberries, which are so delicious in Scandinavia.

Silene acaulis is another native Alpine that is difficult in a way. It is true that it will grow fairly readily, but it very seldom flowers at all freely in the rock garden. Mr. Clarence Elliott, however, says that he has a collected form which is not only superior to the type in the purity of its pink, but is really floriferous, and I always believe unhesitatingly whatever Mr. Elliott says—about horticulture. Dryas octopetala has the same shortcoming as Silene acaulis, for in most gardens it is very niggardly of its large and distinguished flowers.

Our native Alpines all occur again in the Arctic, and I have an impression, which may be incorrect, that a rather large proportion of the species which are common to the Alps and the Arctic are difficult to cultivate, and, if this is true, I should be very interested to hear an explanation of it. F. A. H.

Peaches in the open

Overhead syringings should cease immediately the fruits develop colour, but plenty of moisture at the root is still essential. Those from which the crop has already been gathered may be syringed vigorously in order to check Red Spider.

Ornamental kinds of Ash

AMONGST our forest trees none are more variable than the Ash, the different varieties of which are almost endless, and the same may be said of the American kinds. The American Ash is, as a rule, lighter-coloured both in foliage and bark than ours, but the colour varies a good deal in individual specimens. There being so many varieties of the common Ash, I will divide them into groups according to their peculiarities, and take those first distinguished by

REMARKABLE HABIT.—The Weeping Ash, from its peculiar manner of growth, is often used for covering, or rather forming, arbours, as, if supported, the branches may be made to extend horizontally to a great distance. Of this there is a form having bark of a bright golden colour, which is very showy, especially in winter. The Crested Ash (Fraxinus excelsior cristata) is a dwarf variety, often with fasciated Cockscomb-like stems, more curious than ornamental. Spectabilis, a fine form of the common Ash, is stouter and more upright-growing than the type. Crispa or nana is a small-growing kind, in which the leaves are very dark green and much curled, in many cases surrounding the stems, as in Salix annularis. Globosa is dwarf and globular in growth, forming a miniature tree. Dimorpha is so small in all its parts as to form a twiggy shrub, but one in no way stunted in appearance.

FOLIAGE DISTINCTIONS next come under notice. Amongst these the variegated forms of Ash, as a rule, withstand the sun with impunity, being rarely scorched, however exposed. In alba variegata and aurea variegata the leaves are marked with white and yellow respectively. In lutea the foliage is wholly of a golden colour. Heterophylla variegata
is a variegated form of a very distinct

there is a tendency for the leaves to
he whole surface, I advise the cutting
f a portion of the leaves, as no harm
ise from so doing and the effect will
ly improved.

nthemums

igs are already troublesome and
e trapped with short lengths of
Bean-stalks, which may be pushed
the growths and stakes, each to be
ied and their contents blown out every
g into pails of water containing a
troleum. Stopping and tying is con-
ork which must not be neglected, and
g must be freely indulged in if the
re to be kept in a clean and healthy
tion. A weekly application of weak
-water will now be advisable.

nthus

of one or more of the many beauti-
ins of this fine indoor plant may now
in pans of light soil and raised in a
cool frame. Avoid high, close temperatures, and when the seedlings are large enough prick them off singly or in threes into 3-inch pots and keep the plants close up to the glass. Grow them on under cool, airy conditions. Clarkias and more Mignonette may also be sown and treated similarly.

Spring Cabbage

Stir up the soil between the lines of those sown last month and sow a few more to furnish plants for late work. Turnips and Spinach for winter use may still be sown on good and well-prepared ground.

Late Peas and Celery

These should be abundantly supplied with water, including generous overhead watering, and given occasional doses of liquid-manure. The same applies to Scarlet Runner Beans, which take a lot out of the soil. Keep the older Beans removed from the Vines, otherwise there will be a tendency towards light cropping and flower-dropping.

Asparagus

Frequent applications of manure-water are advisable to assist the plants in the building up of strong crowns for next year's crop. This is liable to be neglected at this season.

Tomatoes in the open

Keep the plants to one leader, feed liberally, and reduce the leaves below the fruits to half their length. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Border Carnations

The layering of these must now be pushed forward with all speed or rooting before the advent of cold weather will be impossible if delayed much longer. Should the dry weather continue, much watering will be necessary to encourage the rapid formation of roots. Birds sometimes cause much damage by scratching away the soil from the layers. In bad cases netting is the only remedy.

Pentstemons

In many cases Pentstemons throw up their central flower-spike much too early, and this, naturally, encourages the rapid development of side shoots. These now show flower, which, while ensuring a display, makes it very hard in autumn to find suitable cuttings. It will be advisable, therefore, to secure any suitable growths as they appear, and this will encourage the plants to push out others that, in turn, may be found of great value.

Pansies and Violas

These have had a "rocky" time of recent weeks, so every cutting procurable will be welcome in many gardens. As with Pentstemons, do not wait until the usual propagating season, but secure every one as it becomes fit. When forced to insert these cuttings in small quantities it is most satisfactory to insert in boxes.

Prepare for autumn propagating

Although early enough for the general autumn propagation of the various subjects, stocks of which are increased or perpetuated by this means, it is yet well to have everything ready, as far as can be managed, before the actual work of taking cuttings begins. Frames should be overhauled and broken glass repaired, so that all may be watertight. Boxes, also, should be repaired thoroughly, while pots should be scrubbed clean and set aside to dry.

Roses

To encourage the production of a fine crop of autumn flowers all spent flowers should be periodically removed, while frequent hoeing of the surface between the plants, besides keeping down weeds, is excellent for the Roses. As a rule, the modern Rose produces, in most cases, far more buds than it is possible to develop properly, so a rigorous thinning of these should be systematically carried out, and the resulting improvement in the size and colour of the flowers will more than compensate for the little time expended.

Climbing Roses

As these go out of flower the old, worn-out wood should be cut clean out and the strong, young rods springing from near the bottoms of the trees tied loosely, but securely, to the supports. Any weakly growths should also be cut away in order that all the available strength may go to such as are required to cover walls or trellis. When planted against walls these Roses are especially apt to suffer from dryness at the roots, so a thorough soaking of clean water, followed the next day with a further drenching of liquid-manure, will effect a great improvement.

Black Currants

As a rule, the bushes are now cleared of fruit, therefore when time can be spared any necessary pruning should be carried out. This simply means that old, worn-out branches should be cut back to near the ground-level and thus provide more space for the young, strong growths that spring from the centres of the bushes. The ground should also be cleared of weeds, and all prunings burned at once.

Housing fruit nets

Immediately a crop is gathered, the ends of the nets resting on the ground should be freed of any foreign matter and then thrown up to dry. The moment they reach the "bone-dry" state have them taken down, neatly pleated, then rolled into as small bulk as possible, and finally hung in some perfectly dry shed until again required.

Potatoes

Continue to dig up these as they become ripe, for to leave them in the ground for any length of time after this stage is reached is to run the risk of loss from disease and vermin. Select such quantities as may be required for "seed" of the different varieties. Medium-sized, shapely tubers are best for this purpose, and should be placed in shallow boxes and be well "greened" before being stored away for the winter in some cool, light, and frostproof shed or cellar.

Plant spring Cabbages

Plants from seeds sown early in July are now fit for planting out in their permanent quarters. The site recently vacated by early Potatoes is about the best possible spot for these Cabbages, and should not be dug. All weeds and débris should be removed and the surface well hoed and levelled. Allow about 18 inches from plant to plant each way.

Sowing vegetables

Where such vegetables as Cabbages, Brussels Sprouts, Savoys, and curled greens can be got to survive the winter in the open the present time is very suitable for getting in the seeds. Sow thinly, broadcast, and select rather poor ground for the purpose. Cauliflower may also be sown now, but the seedlings, when large enough, must be pricked into a cold frame for the winter.

C. BLAIR.

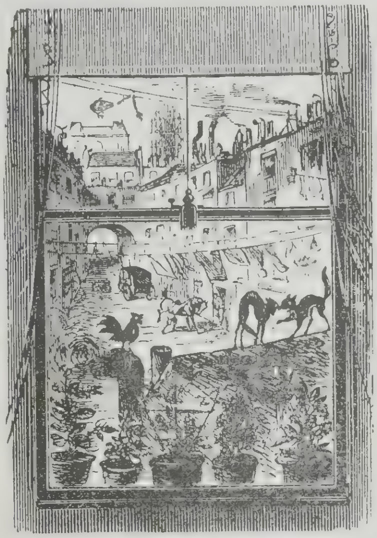
Preston House Gardens, Linlithgow.

From Gardening Illustrated

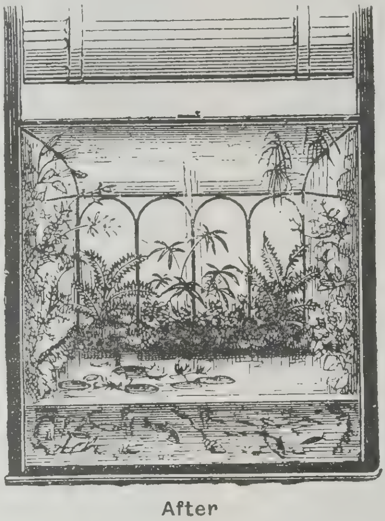
Fifty Years Ago

London window gardening

THE annexed woodcuts, sent to us by Messrs. Dick Radclyffe and Co., High Holborn, suggest how the dismal look-out of many a London window may be obviated, and even rendered attractive, by a case of beautiful Ferns or other plants.



Before



After

Vegetable Marrows on railway embankments

We notice that Vegetable Marrows grow vigorously on railway embankments on the south side of London. They have a deep and, as a rule, a loose soil in which to grow, and, being in an exposed and sunny position, they not only grow well, but fruit with marvellous freedom. Bare spaces of this kind might be more frequently devoted to the growth of this vegetable, which, if left to ripen and stored, will furnish wholesome food all through the winter and go far to compensate for the losses sustained by the failure of the Potato crop.

How to destroy ants

Take an ordinary flower-pot, say, a 5-inch pot, and turn it upside down on or near the place or places most infested with ants, and in the course of two or three days the ants will have three parts filled the pots with soil, and thousands of both the working ants and the male and female ants, with thousands of eggs, may at once be destroyed by means of boiling water. With a funnel pour it through the hole in the bottom of the pots, and in half-an-hour take off the pot, level down the soil, and replace the pot, and so follow up with boiling water in this way and your place will soon be cleared of ants.—August 16th, 1879.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FLOWER GARDEN

Diseased Phlox

(E. R. Stevenson).—The specimen Phlox sent for examination is affected with Stem Canker, a fungus which attacks the plants just about the soil level. The result of an attack is that the stems develop a cankered appearance, the leaves turn yellow, and the attacked growths frequently break off. As the fungus is deeply seated within the tissues of the attacked shoots, control is difficult. The only successful method is to cut out and burn the affected growths. Surrounding growths should be sprayed with a weak solution of liver of sulphur. It is probable that a thorough soaking with a solution of Cheshunt Compound would deal with any loose spores lying about on the soil.

Diseased Tulips

(D. Wolseley).—The Tulips were taken out of the soil too early, with the result that they have failed to ripen properly. Saprophytic fungi have gained an entrance to t
ripened bulbs and destroyed them.
do nothing now except to sort over t
and throw away those affected.

oli diseased

Clifford).—Your Gladioli are affected fungus of the Sclerotium type, but we able to state whether or no the corms affected when bought. In the speci- s sent the underground portions are ty, but we think that it is likely that a rms failed earlier in the season, and it n these that the infection has spread. e afraid that at this stage you can do xcept to spray the plants with a weak n of lime of sulphur or some such ide. You might try the effect of giving l in which the plants are growing a ig with Cheshunt Compound. Up to esent time the control recommended 's disease is to soak the corms for 30 s in a 5 per cent. solution of formal- , then wash thoroughly in clean water ant in clean ground. You might like this treatment next spring.

GREENHOUSE

olaria

Constant Reader ").—You doubtless Calceolaria fuchsiæfolia, a greenhouse en variety. It is rather a troublesome being like some others of similar habit, asily upset by too frequent watering, t it detests getting dry at the roots. t rich compost, consisting of fresh, loam, leaf-mould, and sand, with the n of a little very fibrous brown peat, it its requirements. Pot rather lightly in quite a cool house, shading from ht sunshine. Cuttings of half-ripened about this time and again in early usually root in time, but considerable e and watchfulness are necessary.

igid Anemones

S.).—The St. Brigid Anemone does e very kindly to greenhouse culture, planting the roots in autumn in pots s of light compost, setting these in a me over winter, and in spring moving tle warmth in the greenhouse they induced to bloom fairly well. Place ms quite close together, but do not overcrowd. If placed in boxes, about s apart would be a suitable distance. tle water will be required all winter.

as in pots

gonias ").—While the Begonia dis- ld draughts it even more quickly re- damp, stuffy atmosphere, and, without g your treatment of your plants, we e inclined to think that this is causing s to drop. Under glass the Begonia shaded from the sun and be carefully . It should never be allowed to get ry, but at the same time to keep the stantly saturated is bad for the plant.

ROSE GARDEN

ed Roses

lia).—There is no fungus present in e specimens sent. Thrips are present tity, but we think it unlikely that this the actual cause of the trouble. A kely cause would be night insects, earwigs. Some such creatures are he buds in a young stage, and the l buds fail to develop satisfactorily. e the plants at night with a light, and try and catch the culprits at work. If earwigs are the cause of the trouble they can be trapped by placing inverted flower-pots loosely stuffed with hay near their haunts. The traps should be examined once a day and the earwigs collected can be destroyed. If Thrips is the sole cause of the damage the pest may be kept under control by copious syringing with cold water, but in bad cases it is as well to commence operations by using a good insecticide first and then follow on with the water treatment.

Rose diseases

(M. F. Ebbs).—Your Rose specimens are affected mainly with mildew, but there is a little Black Spot present. Many sprays have been recommended as controls for Rose mildew, most of which, if used often enough, will give a fair measure of success. We have lately seen good results obtained by using sodium bicarbonate 1 oz., water 10 gallons. The bicarbonate is dissolved in a little water and then made up to 10 gallons with clean, soft water. This spray fluid is known as a "hitting spray," *i.e.*, it only kills the mildew that it wets. If this is remembered it is apparent that fairly frequent sprayings are necessary, beginning fairly early in the season as a preventative and continuing throughout the growing season as occasion demands. If you used the above spray regularly from the beginning of the season you should be able to keep the Black Spot under control. Basic slag should be applied at the rate of 4 ozs. per square yard in autumn before the forking over is carried out. Under your conditions sulphate of potash at the rate of 1 oz. per square yard should be used instead of potash salts at 4 ozs. per square yard. The sulphate of potash might be applied in February next as a top-dressing and hoed in. If you are unable to obtain soft water considerably more bicarbonate should be added, because your district is noted for its hard water.

TREES AND SHRUBS

Hollies dying

(Capt. J. Whitworth Jones).—You do not say how long your Hollies have been planted, therefore we presume them to be established plants and not suffering from drought. Have you examined the base of the stems for trouble by mice or rabbits, as these often bark them, and once the bark is nibbled off all round the shrub is sure to die? Insect life will sometimes cause a large amount of disfigurement, but rarely kills the shrub outright. Examine the trees for moisture at the roots, and spray them thoroughly with half a pint of paraffin to 5 gallons of water, the paraffin being first mixed with a small quantity of boiling water, as it will not mix with cold. We know of no other reason for the behaviour of your shrubs.

FRUIT

Strawberry plants

(Anglesey).—We have examined your specimen Strawberry plants and can find no fungus present which would account for the failure. A little Leaf Spot (Sphærella fragariæ) was present, but not in sufficient quantity to cause damage. The root-systems were in both cases sound. The failure of the plants appears to us to be due to an attack of an insect, probably a capsid. Now that the plants have finished fruiting you should go over the bed and cut away all dead tissue, and also all the old and discoloured foliage, and the material so cut away should be burnt and the ash returned to the bed. Go over the plants and make sure that they are firmly established, and if any are showing the crown of the plant any distance above ground-level soil should be drawn up to the collar so that the crown is just clear of the soil. Previous to earthing-up the plants that require it give the whole bed a dressing of superphosphate at the rate of 1 oz. per square yard. Sulphate of potash applied in early spring, also at the rate of 1 oz. per square yard, would help the plants. Spraying the plants from time to time with a nicotine wash would control any insect pest present.

Cracked Apples

(E. B. Lister).—The specimens you have sent for examination are affected with Apple Scab, a condition brought about by an attack of the fungus Venturia ineaqualis. This fungus attacks the wood, leaves, and fruit of the Apple, and can be controlled by spraying with Bordeaux Mixture or lime sulphur. The control commences when the flowers are in the so-called "Pink Bud" stage, *i.e.*, when the flowers are showing colour, but before the petals begin to open. A thorough spray, using one of the above fluids, should be given. A second spray should be given when most of the petals have dropped from the flowers, and a third dressing three weeks later. You can do nothing at this stage to improve your fruit, but if you carry out the spraying recommended above you should be able to prevent such unsightly fruits another season. You will find that the Leaflet No. 131, Apple and Pear Pests, to be obtained post free from The Secretary, Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W. 1, would be useful.

Excrescences on Apple wood

(Mrs. Harbord).—The specimen Apple growth sent for examination is showing a number of aerial roots. Such growths are quite normal on certain varieties of Apples and need cause you no undue alarm. There is one old variety called Bur-Knot which produces these aerial roots in great numbers, and this variety will root very well if the shoots are cut off and inserted as cuttings. Many varieties of Apples produce these roots to a greater or less degree, *e.g.*, Warner's King is sometimes covered with them. A good tar oil wash applied during the winter would ensure that any hibernating insects sheltering within the growths would be killed off. Apart from the shelter given to insect life by the aerial roots they cause no other trouble.

Apple trees

("Niko").—Good non-poisonous insecticides are "Katakilla" and "Volck," and these, if properly used, should rid your trees of vermin in late spring or summer, but it is less easy to suggest a non-poisonous preparation for winter use. However, a safe, and if carefully applied a quite satisfactory, winter wash is made by slaking 18 lbs. of lime and then adding 4 gallons of water. In another vessel dissolve 3 lbs. of salt and 1 lb. of waterglass, then mix the two together and thoroughly spray the trees with this solution during February.

Diseased Apples

(E. R. Stevenson).—Your specimen Apple is badly affected with Apple Canker, a fungus which causes a lot of trouble amongst Apples, especially certain varieties on some types of soil. The only control is to cut out and burn the affected branches below the cankered portion. All cuts made should be coated over with white lead paint or grafting-wax, and the work is best done during the growing season. If the tree is an old one it would probably pay you to grub it and replace with a variety which is not prone to canker. The Ministry of Agriculture states: "Amongst the varieties usually less susceptible may be mentioned Annie Elizabeth, Beauty of Kent, Blenheim Orange, Bismarck, Bramley Seedling, Lane's Prince Albert, Mr. Gladstone, and Newton Wonder." All varieties are liable to canker on badly drained soil, and also when too much nitrogenous manure is applied.

Morello Cherries

(A. C. S. S.).—It is seldom that there is any necessity for root-pruning the Morello Cherry unless it has been planted in extra rich soil. On no account cut away the shoots you mention, but train in as many as you can find space for, but not, of course, overcrowding. Such as space cannot be found for can be cut away. Young trees are seldom fruitful, but in time usually settle down to produce heavy annual crops.

Quince tree

(G. S. Eastment).—Although you have given water to the Quince tree it is more than likely that dryness is the cause of the fruits dropping. This fruit only thrives properly when the roots are in very moist soil. Planted near the edge of a stream or pond, where the roots can find their way to the water, they seldom fail.

Currant cuttings

("Propagator").—While, doubtless, cuttings inserted now would root all right, we fail to see how any advantage is to be gained by doing so. The usual and entirely satisfactory time for carrying out this work is just after the leaves fall. The process is simple. Select fairly strong, straight shoots of the current season's growth, cut through just under a joint, and carefully trim off all eyes or buds from the lower part of the stem, in the case of Gooseberries and Red and White currants leaving only three or four eyes near the top. Black Currants should have all eyes retained. With a spade make a notch some 4 inches deep where it is desired to plant the cuttings. Stand the cuttings upright in the notch, return the soil, and tread down very firmly. If the soil is very heavy a layer of sharp sand should be scattered in the bottom of the notch, and on this the bases of the cuttings should rest.

Peaches stone-splitting

(Y. A. T.).—Permitting the soil to get dry and then applying copious drenchings of water will account for stone-splitting. So would too strong doses of liquid-manure or artificial fertiliser. Some varieties of Peach, however, are liable to this trouble, and only great care in watering, airing, and feeding will avert it.

Diseased Peaches

(F. Calvert).—In connection with the specimens sent in for examination, there are two diseases present. The rotted fruit was affected with Brown Rot, a fungus common on Plums, Cherries, and, to a less extent, Peaches. The fungus attacks in turn flowers, leaves, wood, and fruit, but is perhaps most common on flowers and fruit. When pruning, look carefully for dead snags of tissue and dead tips of young wood; all these should be removed and burnt. All fruits affected should be removed from the tree so soon as detected. If taken in time, most of the fruit could be used for culinary purposes, but the actual diseased portion should be burnt. Fungicides have proved of little value in connection with this disease; cutting out and burning the affected portions is the better way. All the foliage sent is affected with another fungus, Puccinia pruni, which causes a leaf rust, and attacks Plum, Cherry, Peach, Apricot, Almond, and Blackthorn. Nectarine, being only a variety of the Peach, is also attacked. One of your fruits was badly spotted with this disease. You can do nothing to control the disease until after the fruit is picked, then spray the tree with dilute lime sulphur. After the leaves fall, they should all be raked up and burnt. Spray again at intervals next season, beginning when the leaves are expanding, using again dilute lime sulphur.

Scalded Grapes

(W. H. Barber).—The details of cultivation given appear to us to be in order, but you must remember that it is never easy to grow Vines and Peaches well in the same structure. We do not think your trouble has much connection with ventilation, but your local adviser should be in the best condition to judge. We notice that in your manurial treatment no mention is made of potash, and that the manure used is mainly nitrogenous in character. We think that if you give sulphate of potash each year at the rate of 1 oz. per square yard, both to the inside border and also to those roots growing outside, you will get a gradual reduction of the "shanking." The berries splitting just before getting ripe points to the Vines getting too much water during the final stage of ripening. Are the roots actually near enough to the little stream to obtain water from it? If so, it might explain matters. The sulphate of potash mentioned above should be applied in addition to the manures you are already using.

VEGETABLES

Cabbage Caterpillar

(Meiktila).—The caterpillars you sent are those of the Turnip Moth (Agrotis segetum). The creature is one of the so-called "Cutworms," which is the name given to the caterpillars of certain moths, the larvæ of which eat through plants just at the collar, cutting off the plant at ground-level. "Cutworms" spend the day in the soil and feed at night, sometimes feeding on foliage, but more generally upon the fleshy stems. The Vaporite given last year could have no effect on the pest because it was probably not then present. Another dressing of Vaporite would be a good control if applied now. The pests may easily be killed by using poisoned bait, but in view of the Protection of Animals Act, 1911, it would appear that the treatment can only be used where all reasonable precautions are taken to keep away cats, dogs, fowls, and other domestic animals. A successful recipe is: Bran, 1 bushel; Paris green, 1 lb. The Bran and Paris green are first well mixed together dry and then water is added to make a fairly dry mash. The mash should be broadcast on the soil towards evening. The mixture is sown at the rate of 2 bushels per acre, and this rate would work out at about ½ peck per 200 square yards. Gloves should be worn when mixing and sowing the poison bait. A bushel of bran equals 17 lbs.

Early Peas

("Little Welshman").—It is only very early varieties that you can hope to have fit for market in May and June. If sown in October, occasionally, The Pilot will come safely through the winter and become fit for use by May. For spring sowing this variety should also prove satisfactory. Sown in February it should be in use in June. It is 3½ feet to 4 feet in height. The dwarf sorts, Peter Pan, William Hurst, and The Lincoln, are all very early sorts, and if sown early in March should be fit during May and June. The last-named is about 2 feet high, the others 15 inches to 18 inches, and all are good bearers. If sown about the middle of March, King Marrowfat and Senator should be ready during the latter half of June, and both are very heavy croppers and average
about 3½ feet to 4 feet high. Most se
stock these, but if you have any difficu
can get all from Mr. John Down
Shandwick Place, Edinburgh. C

is

ve noticed by a particular Blackberry at fairly regular intervals, pieces of adder skin. I once saw the snake, was a big one, glide into this same berry bush. To-day I found by the a complete cast-off skin, which es 37½ inches long. I have often gone etly to the bush in the hopes of being surprise and kill the snake, but with- ccess. On the one occasion which I it, I had nothing with me with which with it. As this bush is close to a th where children are walking and laying, I am particularly anxious to adder. Also, a bite from one of this uld, I should think, be fatal. This is gardening question, but I wonder if any of your staff know anything about bits of adders and the best time of me to wait for it or stalk it? Also have ever heard of a way of trapping oning them?

D. V. Peyton Ward.

Hants.

you sure that the snake you have seen dder Vipera berus, because the length inches is unusual. Thirty-two inches posed to be about the extreme length dder, but the grass snake is often over in length. If you have any doubts the identity of the specimen, why not aturalist have a look at the cast skin? e of the adder rarely proves fatal, but son causes much pain and inflamma- which lasts for a considerable time. d of the adder consists chiefly of frogs ice, and as these are, we believe, taken alive, poisoning the creature out of the question. All snakes are nd of lying in the sun, and it is probable that on the occasion you saw the snake you had disturbed it while lying in the sun. Your only chance of destroying the snake is to proceed very quietly to the spot when the sun is shining and attempt to kill by striking it. You will be most likely to find the snake lying in the sun towards noon, Greenwich time. If it is only a grass snake you should let it live, as they are valued friends for the gardener. We do not think you are likely to have much success in lying in wait for the creature. Your best chance will be to surprise it.]

NAMES OF PLANTS

R. M. Staveley.—Gladiolus Halley.

Miss F. Mordaunt.—Spiræa discolor.

"*Cutler.*"—Achillea Ptarmica The Pearl.

W. R. J., Cornwall.—1, Rosa rugosa alba; 2, Eryngium giganteum; 3, Verbascum Hattoni; 4, Tradescantia virginica rubra.

J. O.—Olearia nummularifolia.

A. Andrews.—This appears to be a plant which has in some way been crossed with another member of the Cabbage tribe. We have not seen anything like it before, and it might be worth your while to allow it to seed and see what comes of it next season. We can give no reason for its appearance among your crops, other than that of a chance seedling.

Amateur.—1, *Mauve,* Funkia ovata; 2, *yellow,* Inula grandiflora.

A. E. L.—Linaria purpurea.

H. Mills.—1, Gentiana septemfida; 2, Erica vagans var. St. Keverne; 3, Œnothera missouriensis; 4, Potentilla Mons. Rouillard.

Marmion.—1, Ribes nigrum, probably a seedling (fruits squashed); 2, Veronica Cananillesi; 3, Sedum spurium; 4, Pink, seedling variety; 5, Pink Desdemona; 6, Onopordon illyricum; 7, Spiræa discolor.

I. A. C.—1, Gwen Nash (probably); 2, Dorothy Dennison; 3, Francois Juranville; 4, flowers faded, probably Evangeline.

E. F., Hereford.—1, Saxifraga oppositifolia (poor specimen); 2, Salvia officinalis var. purpurea; 3, A. Philadelphus, but with no flower we cannot say which; 4, Saxifraga cæsia.

LATE NOTE

Plum crops in Worcestershire

The crop of Pershore Plums is stated to show marked variations not only between adjoining plantations, but also between individual trees within the plantations, and this fact renders the estimation of the weight of the crop a matter of considerable difficulty. In the Evesham and Pershore district the Pershore Plum crop is reported to be of fair quality. The yield is estimated at approximately 2 tons per acre, which is considered by the reporters to be a light crop. In the Worcester and Stourport district Pershore Plums are reported to be of fair quality, but the yield is very light and is estimated at only about ¾ ton per acre, though possibly this figure may be exceeded in the area to the west of the Severn. Taking the area as a whole, it is estimated that there is a good average crop of coloured Plums.

WASPEND
A Safe and Easy
WASP KILLER

The best way of dealing with the Wasp nuisance is to destroy them in their nests, and the quickest and cheapest means of doing this is to use Waspend Wasp Killer. A 4d. packet will destroy the whole nest.

Waspend is a NON-POISONOUS POWDER and requires no apparatus nor mixing. Simply spread the contents of the packet in the mouth of the nest. Wasps crawling home take in the powder and not only succumb themselves but kill all others with whom they come in contact.

If any difficulty, write to: Abol Ltd., 11, Beltring, Paddock Wood, Kent.

Per 4d. packet
Destroys the whole nest

Talking of BULBS, isn't it
RIDICULOUS
that so many English people still insist on buying Dutch bulbs, while the Dutchman (who does know a good bulb) buys up all the English-grown bulbs he can get and re-exports to England at a handsome profit? Why not buy direct from the English grower—the best bulbs at the lowest prices?
Write for our free Catalogue.

How do you buy
your BONEMEAL?

FOR immediate and complete assimilation by the roots of your flowers, fruit, and vegetable crops, you need a really pure bone meal; one guaranteed to contain no residue or added matter of any kind. Derrick's 100% pure bone is rich in phosphoric acid, phosphate, nitrogen, and lime; has all the constituents of a perfectly natural fertiliser, and no waste or slowly disintegrating matter Unequalled for all horticultural purposes.

15/- per cwt. *carriage paid*

A free sample will convince you. Write for it to-day.

YOUR
HOME

THE HOUSE, TREES and LAWNS BEING SETTLED, the next thing is to supply Colour from Flowers, and the simplest, most enduring, and most satisfactory colour touch which you can obtain is Borders of Herbaceous Perennial Plants, the best kinds carefully arranged in gradations or contrasts of hues at the foot of walls, or by terrace walks, by grassed walks, near the house, and others in a distant garden.

Kelway's specialise in these beautiful Borders, and supply Planting Plans with the plants. It is "their own invention." Now is the time to prepare. Write them for an Estimate, giving them any requisite particulars of aspect, soil, and area.

Kelway's also send the following Free Catalogues on demand:—Pæonies, Delphiniums, Gladioli, Pyrethrums, Lupines, Michaelmas Daisies, Water Lilies, etc., Colour Borders and Miscellaneous Border Plants, Roses and Flowering Shrubs.

Please write at once.

The Gladiolus Show

New varieties at Greycoat Street

ERALLY speaking, the weather ditions this year have not been good Gladioli. The frosts in February did arm to corms that were not more than protected, and losses of stock from use have been reported from every the country. As a further result of d weather, the ground in many disid not warm through as early as and the earlier-planted corms were germinating in consequence. For ason the successive plantings neceshen a show is in view were not foly successive blooming, and many of y-planted corms flowered before those in the beginning of April. The long in July also contributed to irregular especially in those districts where onomy of water was essential.

te of these disadvantages, the displayed at the Royal Horti- Society's New Hall on 13th were exceedingly good, quality and quantity. Fully the Hall was devoted to this

purposes of description and t the exhibits must be into two sections: those he auspices of the Royal tural Society, and those n the many classes of the Exhibition of the British s Society.

ormer consisted of trade exd the annual competition for remarke" Cup.

e trade exhibits, highest went to Mr. W. J. of Histon, Cambridge, foly the two Wisbech firms, R. H. Bath and Prins, and Kelway and Son, of Langmerset.

main reason for Mr. Unccess was that he not only d flowers, but he staged ther as a display than as a of Gladioli. The secret, m the firm's "flair" in this , seems to be Smilax, s plumosus, and space, hese the most important is Gladioli, particularly the s varieties, lose half their ess if bunched too closely while the large-flowered take very little crowding to mass of colours, often gorours, in which the individu- the flowers themselves is lost.

Messrs. Kelway's exhibit demonstrated this only too well. Their topmost tier, set out with a background of Copper Beech, caught the eye from a distance, and intensified the beauty of the varieties so staged —especially Orby, a magnificent red—but one had to be quite close before one appreciated the charms of Curiosity and Margie Kelly.

Prominent among Mr. Unwin's group were the older primulinus varieties, whose charm of colouring and form still remain unbeaten commercially, Xanthia, Souvenir, Citronella, and Hermione, while among the large-flowered varieties one noticed fine baskets of Catherina and Red Emperor.

Red Emperor naturally calls to mind Red Empress, which was well shown by Messrs. Bath, as were Break o' Day, Nydia, and Salmonea.

Messrs. Prins had quite a number of "blue" varieties, all of which showed to advantage—Mrs. Van Konynenberg, Heavenly Blue, Mr. Marks, and Rev. Ewbank. Another variety shown by this firm was a true primulinus, somewhat curiously called Mauve, a soft rose-carmine, flaked with old rose; a most attractive flower, particularly for decorative purposes.

The spikes shown by Mr. W. E. Phillips, the winner of the Foremarke Cup, were truly magnificent, and those of Vilchenblau, Bertie Snow, Queen Mary (see illustration, page 574), Roi Alexandra, and Gertrude can seldom have been better staged. Messrs. Langridge, the runners-up, had beautiful specimens of Master Weitse, Sappho, and Flaming Sword. Of the other entrants, the most striking spikes were all exhibited by Messrs. Prins, who were placed third. They were Eighth Wonder, a remarkable shade of greyish-brown, Duchess of York (Mair), and Othello, the latter a very fine blue.

Gladiolus Copper Bronze, a primulinus variety with wide spreading petals of a wonderful glowing copper colour, shading to bronze-purple at the edges

Exhibited by Major G. Churcher at the British Gladioli Society's Show

Turning to the British Gladiolus Society, the most interesting class was that in the Open Section for 18 distinct varieties of primulinus (all sections) of sorts introduced since 1926, and/or seedlings. This was well won by Messrs. R. H. Bath, prominent in whose exhibit were two seedlings, Bronze Delight and Spitfire. Major Churcher, the runner-up, had more of the newer varieties already in commerce, the best being Oranco, Mandarin (Decorah), and Polphymnia. A curious white laciniated primulinus, Aquila, and the beautiful Copper Bronze here illustrated, were also of interest.

Premier honours in the other larger classes went to Mr. Unwin with more or less well-known commercial varieties, a few of which, particularly Byron L. Smith, did not appear to be up to the usual high standard of this firm. In the classes for three spikes of a certain colour some old favourites were well shown, noticeably Purple Glory and Souvenir.

Major Churcher, as usual, showed several of the newer American varieties in his exhibits, chief among which were Purple Spot, Trooper, Gladdie Boy, Forest Sprite, Remarkable, Mrs. W. E. Clark, Leen Wone, and Virginia Lou. A word of praise is due to this exhibitor as the only amateur in the open classes. He held his own well besides enabling less experienced growers to gain prizes in the amateur section.

These classes were well filled and showed blooms of surprisingly good quality. The chief prize winners were Mrs. Hennell, Miss Anderson, Messrs. Beauchop, Pritchard, Gregg, Long, Amos, Adkins, Hoyle, and Captain Churcher. The flowers staged were, naturally, mainly of the older type, with an occasional seedling, while of the newer varieties, Dante, Dewdrop, Ethelyn, Taurus, Sheila, and Cygnus were attractive enough to give rise to the hope that they will be more numerous in the future.

In the classes for table decoration several good vases and bowls of both types were shown, Mrs. Yandell carrying off chief honours. In the class for three vases or bowls for sideboard decoration it is a matter for regret that the absence of sideboards detracts largely from the general effect. Had these exhibits actually been shown on sideboards one feels that the positions of first and second would have been reversed, or that the manner of treating these bowls would have been different. In all except one entry a very large sideboard would have been needed to accommodate the bowls without overcrowding.

A very fine collection of seedlings was shown by Mr. Unwin, of which Colin, deep peach, large-flowered, Ruffles, bronze, ruffled primulinus, A. St. Clair Amos, pure shell pink, and Hilda, mother-of-pearl, large-flowered, were the best, and, with Constance, Mamie, Peggy, and What Joy, were awarded Cards of Commendation.

Cards of Commendation were also awarded to Messrs. Kelway for Geoffrey Henslow, scarlet, with white blotch primulinus grandiflorus, and Pamela, a pale magenta Langprim; Messrs. Bath for Pink Gem, coral-pink, with primrose blotch primulinus grandiflorus; and Major Churcher for Anne Croke, a pink, large-flowered Lacinatus type.

Awards of Merit were awarded to Messrs. Bath for Radiance, red, large-flowered; Distinction, scarlet, large-flowered; Rival, white, small magenta blotch, primulinus grandiflorus; Old Rose, old rose, primulinus grandiflorus; Messrs. Kelway for Tapestry, rose-salmon, heavily flaked purple, large-flowered; Major Churcher for Leen Wone, vivid orange self primulinus.

Gladioli for exhibition

Nearly all horticultural societies include classes for these flowers in their schedules. No doubt many thousands of corms have been planted this year by amateurs with an eye to exhibiting. If the soil is fairly good and the drainage efficient, really nice spikes of flowers may be grown, but for competition purposes the spikes must be perfect, without a blemish. To make quite sure of this the plants must be protected from strong winds. This protection must be provided in good time and may take the form of rows of such things as Sweet Peas, Runner Beans, or culinary Peas at a suitable distance. The work of staking also must be performed in good time. It is better to use two neat stakes, and the tying material should be soft and used in such a way that it does not interfere with their growth. When the flowers begin to open, protection must be provided from wind and rain. This may be done by fixing strong cardboard to strong stakes in such a way that the spikes are also afforded protection from strong sun. Fix the screens securely, otherwise they may be loosened and seriously damage the spikes. F. H.

A random commentary on the fortnightly show

ON stepping out of the August sunshine into the different blaze of colour in the Royal Horticultural Society's Hall on Tuesday and looking down on an exhibit of African Marigolds and along aisles of Gladiolus I began to feel how wonderful were the works of man. It was impossible not to admire the masterfulness which had made the simple Marigold so extraordinarily like an india-rubber sponge, made Dahlias like Sea Anemones, and Gladioli like tidies on a Victorian lady's dressing-table. Some people may say that such transformations are undesirable, and complain that they are out of harmony with Nature; indeed they are, but, after all, a florist's flower is not required to be in harmony with anything but ourselves.

Gladiolus Queen Mary, one of the spikes for which the Foramarke Cup was presented

Flowers pale pink, nine expanded blooms on one spike. Shown by Mr. W. E. Phillips, Wood Green, N. 22

Let us take these African Marigolds. They are plants that I once cordially disliked, and even now they seem as out of place in a garden as an Axminster carpet would be there, but in the house they seem to me now to harmonise with their surroundings just because they are stylised and conventional, like the flowers on our fabrics and wallpaper. was a great failure, going to seed at once, and the much-praised Phlox Drummondii is disappointing, only odd flowers appearing at one time. Nemesia has been brilliant, and has lasted unusually well. But on the whole all these are only suited for out-of-the-way borders, as one can never tell from year to year how they will last. I wonder if others find the same? NORTH RIDING.

Rock gardens at Chelsea

Replying shortly to Mr. Penrose, I would say that he is quite right in assuming that I regard him as a very young man—as, indeed, anyone might assume from his letters. They are youthful in that they convey a delightful sense of irresponsibility of argument, and a frisky disregard of the position of the point at issue. All this results in his giving vent to statements in almost the very language used on the Chelsea Showgrounds of 1912 and 1913—" when all was young." In other words, we should all be prepared to envy Mr. Penrose his youth if his ideas were young also, and more commensurate with the standard of art decoration we have arrived at in the garden to-day. The youth of years means nothing—except foolishness sometimes—but the young and freshly-born creative idea is everything.

Mr. P. has not yet answered my query as to why he harps on one man's style—he has only explained his appreciation of one man's instance of that style. He has compared an instance of a majestic style with an instance of a pretty one, and my last reply to him did not intend to be the least bit personal, but merely to direct his attention to the fact that a good critic must not compare instances of unlike styles. A fitting reply to this would be that a good art critic does not exist (though many a bad one lives in the lap of luxury).

Mr. P. says he took the trouble to obtain the opinions from exhibitors, " of lesser lights," etc., and with one exception they declared the exhibit in question to be the outstanding feature, etc., etc.

I suggest that Mr. P. should have consulted some of the " greater lights "; it would have shown more fortitude and confidence. I note that your correspondent has large-sized photographs before him as he writes. I would also point out to him that the unusual height of a piece of rockwork in a limited space is more likely to make the result look " flat " than otherwise. The word " flat " is used to express the blurred effect on the eyes caused by any piece of work having failed to convey sufficiently distinct form, composition, and design.

For Mr. P.'s further instruction, I would like to say that all artists in clay, paint, or rock garden stone are in the habit of stepping back from their work to view it at a distance in order to see how it " holds together." The high lights then shout, the shadows hum, and if all are in harmony there is a good piece of music. One cannot say what the view-point of a Chelsea rock garden is going to be. Whilst looking at a very good piece of work in the last show, I had to line up with others —my right foot rather sore and the unconscious, but painful, tread of a Chelsea pensioner on the other—and with undamped enthusiasm and a stoical and patriotic disregard of physical pain, declare to the artist my appreciation of his effort.

In one part of Mr. P.'s article he seems to imply that people who disagree with him have an axe to grind, a suspicion common to youth, and, indeed, if I believed in awards, I would give Mr. P. first prize for his delicious egotism—a literary Adonis, lightly prancing through the vulcanic glens of those whose work it is to merely dam the streams and blast the mountains of this our earthly Paradise. J. WOOD.

In praise of magenta

What is the reason for the prejudice against this colour? In Victorian times it was apparently regarded as a " dreadful colour, my dear, so flaunting and vulgar," but why so many people refuse to have this colour in their gardens to-day passes my comprehension. Even Miss Jekyll, in the article she recently wrote in your paper, stated that with so many fine reds available, magenta could well be dispensed with. As magenta can hardly be called a red, I do not understand her condemnation of it on this score.

If we refuse to countenance this colour, we must deprive ourselves of the wonderfully rich and glowing tints of Phlox Reichsgraf von Hochberg, Eclaireur, and Prof. Went, Erodium Manescavi, Geranium sanguineum, Calendrinia umbellata, Gladiolus Jacoba von Beierm, Primula Beesiana, and many others, many perennial Asters, Incarvillea grandiflora, Liatris pycnostachys, and the Lythrums, to mention only a few, and these plants are in my opinion much too useful for giving variety to the general colour scheme of the garden to be discarded. If a little thought is given when placing these plants, most pleasing effects can be produced. Magenta tones well with some pinks (do I hear feminine shrieks of disgust) and blues, and contrasts splendidly with yellow, orange, and white. Even orange-scarlet looks well with it.

Magenta, in its various shades, is a most useful and satisfying colour for creating richness and variety in the garden colour palette, and these few words in its defence are, I think, very much overdue.

Carpenteria californica

As many of your correspondents seem to be in doubt as to the hardiness of Carpenteria californica, which we have been most successful in growing and flowering for the past 15 years, having withstood 30 degs. of frost, I am prompted to write you a few notes about this good shrub. I also have great pleasure in sending its photograph, taken on July 18th last. Flowering quite a fortnight later than usual owing to climatic conditions, it is certainly one of the most beautiful of hardy evergreen flowering shrubs, and ought to be better known, as its merits deserve. On the ends of the current year's wood it bears in great profusion pure white Anemone-like flowers, 3 inches across, with showy yellow stamens. It is a most attractive shrub, especially when grown in an open border.

The plants enjoy a cool root-run and water in plenty during the growing season, and in spells of drought as we have had for the past three months here, but good drainage is most important. Not being able to dig peat on this estate, we had to use at planting time two-thirds sandy loam and one-third of decayed leaf-mould and manure. An annual top-dressing of the same compost greatly benefits the plants in spring. My object for this note is to convince lovers of choice shrubs who seem to be in doubt as to the hardiness of this shrub that it can be grown successfully even here in East Essex. Experience is the best teacher.

The three plants in question were planted 15 years ago in a south border, backed up by suitable evergreen and deciduous flowering trees and shrubs to protect the plants
from the N.E. winds. Summer-leafin
planted some distance away afford the
sary shade so essential during the
part of the day. This prolongs its flo
season. A few evergreens only afford
tection to the plants last winter,
the S.E. biting winds reached them
registered 32 degs. of frost here on tw
sions last winter, which ought to be
as to the shrub being hardy in the
parts of the British Isles.

The stock is readily increased by l
in early autumn and cutting of half-
wood in August. No pruning have ou
received beyond removing the dead
stems when past their best, to preve
forming. The illustration shows the
of the treatment given. S. K

Rosmarinus officinalis

well-known, fragrant, hardy ever-
rub, popularly known as Rosemary,
much appreciated, and is grown in
very medium or large-sized garden,
the herb border, kitchen garden, or
rubbery. Hailing from the Mediter-
region, it has been cultivated in
gardens from time immemorial. It
dense evergreen shrub, well-grown
s attaining a height of 6 feet to 7
l as much in diameter. The plant is
d with small leaves, dark, glossy
bove and white-felted beneath, aro-
y fragrant when crushed. The pale
e and white flowers are produced
in clusters of two or three in the leaf
the previous years shoots. Old speci-
velop short, rugged trunks, which
added charm to this fine shrub. It
ly species of the genus, but there are
distinct forms in cultivation. Rose-
closely related to the Lavender, and
quently associated with the latter
gardens. It is not in great demand
ary purposes, but the leaves contain
nt essential oil in considerable quanti-
h used in perfumery, preparations of
shes, and for Oil of Rosemary.
y speaking, it is not quite so hardy
der, though it is very rarely injured.

It is, nevertheless, an excellent plant to cultivate, and especially so where bees are kept. Bees are partial to the plant, and the honey produced from Rosemary flowers is considered to be of a distinct and most pleasing flavour. Rosemary is particularly easy to cultivate and will succeed on almost any soil, but the best results are obtained by planting in a well-drained, sunny position. Plants may be raised from seeds sown in shallow drills on a warm, sunny border. Propagation is also effected by cuttings made from young shoots taken off at any time during the summer; these should be inserted in a shady border, where they will soon form roots and be fit to plant out the following spring. To keep plants in robust health, a top-dressing of manure should be applied annually in the autumn and forked in at the beginning of the year. J. L.

Water Lilies and other aquatics have been remarkably well shown by Mr. Amos Perry at recent meetings of the Royal Horticultural Society

In this illustration Nymphæas in many colours are seen at their best

Summer pruning

Trees bearing their fruit on spurs should have their energy directed to the building-up of the buds at the base of the current year's shoots, and those who have not carried out their summer pruning should do so at once, cutting the shoots back to five leaves. There is little danger after this date of secondary growth being made, and many prefer to do the operation in August rather than at an earlier period. Raspberries will also claim attention. All the old fruiting canes should be removed and the weak ones of this year's growth that overcrowd to the detriment of the future crop. Some defer this thinning-out until winter, and even to spring. This is a great mistake, and is paid for dearly in diminished crops. Preserve carefully all the leaves on the canes left, and remove all weeds. If attention is given to these details at this season it will bring its reward in the shape of better and more crops next year.

F. H.

Thame Show

Thame Show, which goes back as far as 1855, anticipates a big event this year on September 19th. Usually about 30,000 people attend the show, and something like £2,000 is offered in prizes. One of the most attractive classes is for an arrangement of pot plants or cut flowers on ground space 15 feet by 5 feet, open to amateurs, including gentlemen's gardeners; the first prize in this section is £6, together with Challenge Cup. There are excellent opportunities for the trade to make displays. Entries should be made to Mr. E. Colston Bush, Thame, Oxon, before August 29th.

The Schizanthus and How to Grow It

WHILE Schizanthus, the finest of all annuals for pot culture, can be raised at almost any season of the year, there can be no doubt that August sowing gives by far the best results if proper treatment be accorded the seedlings. During the second or third weeks in August the seeds are sown thinly in pans of light, sandy soil, set in a cold frame, and shaded from all sunshine until germination takes place, which is usually in five days. As soon as the little seedlings are noticed, have the pans raised up close to the glass to prevent them drawing up weak and spindly and with long joints, instead of sturdy, dwarf little "chaps" with firm, upright stems, which is what one desires as a foundation for the future graceful specimens. As soon as the plants are fit to handle, have them pricked off into ordinary cutting boxes, or, better still, into 3-inch pots, where they must remain until February. If pricked into boxes they must, before winter sets in, be transferred to 3-inch pots. In this, and indeed also in later stages, do not be tempted to use rich soil. The best medium I find is three parts turfy loam, two parts leaf mould, and one part clean, coarse sand. Should the loam be of poor quality, a very small quantity of Ichthemic Guano, say a 3½-inch potful to each barrow-load of the other ingredients, may be given. Make the soil moderately firm, water through a rosed can, and return to the frame, keeping close and shaded for a week to permit of the roots taking a proper grip of the new soil. When sharp frosts are likely, remove the plants to a shelf near to the roof glass in a house or pit from which frost is excluded. By the time this stage is reached, the little plants will be 3 inches to 4 inches high, and should have the points pinched out, so as to induce a bushy form of growth. Further pinching will be necessary as fresh growths spring up, and this must be attended to until mid-February, when sufficient branches should have been produced to furnish good specimens. During winter very careful watering is necessary, the Schizanthus quickly resenting constant saturation of the soil, while dryness at the roots is almost equally destructive. At the time of first pinching, a small, thin stake should be placed to each plant, or they are apt to tumble over and become ungainly. About the middle of February the plants should have a shift into larger pots. If only for decorative purposes, this may very well be the final move, as splendid plants can be grown in 5-inch pots, 5½-inch, and 6-inch pots The pots must be quite clean, and have a fair amount of well-arranged drainage provided. The compost must not be very rich, or rank, long-jointed growth will result. Three parts turfy loam, two parts leaf-mould, and one part coarse sand will do admirably, although a little bone meal may, with advantage, be added. Pot moderately firmly and return to same house, and as close to the roof glass as can be arranged. Water very carefully, and before the shoots begin to tumble about, shake neatly, bamboo tips being excellent for this purpose. As growth advances, continue tying to the stakes as becomes necessary, and should there be any lack of vigour after the pots are well filled with roots, a little gentle feeding may be administered. Soot water is good, and a dessert-spoonful of Ichthemic Guano in a gallon of water is also excellent if given about once a week. Abundance of fresh air on every favourable occasion will keep the plants in good health and improve the colour and brightness of the flowers. Cold draughts, however, must be guarded against, or mildew will soon disfigure the plants and destroy the freshness of the flowers. Treated in this way, the plants will be decorative for nine to twelve weeks. If large specimens are aimed at, the strongest plants should be chosen, and these be given several shifts, until the 8-inch or 9-inch size of pot be reached. These, also, may have more frequent supplies of liquid nourishment after the pots are filled with roots. Some growers, to ensure having large specimen plants, place three good healthy plants in each pot, and so effect their purpose. In any case, a good strain should be grown, as it is just as easy to manage as an inferior one, while the satisfaction experienced at flowering-time more than compensates for
extra cost of the seed. There ar
good strains, but the widely-kno

New Dahlia Mrs. Durham, a very large glowing bright pink decorative variety with a long stiff stem. Selected for trial at Wisley

Shown by J. Stredwick and Son

New Selected Dahlias

E first meeting of the Joint Committee
the Royal Horticultural Society and
tional Dahlia Society of the current
was held in the New Hall of the
Society on Tuesday, the 13th inst.,
uite an interesting series of novelties
ubmitted for adjudication. The fol-
new varieties were selected for trial
ey next year.

NIE (to be renamed).—This is a dis-
promising Cactus Dahlia suitable for
on and for the garden. It is a large
some 8 inches to 9 inches across,
long florets twisting, and forked
building a flower of beautiful Cactus-
rm. Colour, flesh-pink with creamy-
base. Strong, erect flower-stalk.

W. E. Phillips.—A massive-looking,
lecorative, of good form, having broad
twisted and pointed at the ends,
g a flower of splendid quality some
s to 9 inches across. Colour, bright

DOVE (to be renamed).—Another
ng Cactus Dahlia, having its blooms
n long, stiff, erect flower-stalks. The
are long and narrow, slightly incurv-
ilding a bloom of attractive form.
rose-pink on creamy-yellow ground.

D. Durham (illustrated).—This is a
ge decorative, with very broad florets
arranged, building a massive bloom
quality, quite devoid of coarseness.
Colour, a pretty bright pink, slightly paling towards the end of the florets. A special note should be made of this variety, as the blooms develop at a pleasing angle on the flower-stalk. The foregoing four varieties were all shown by Messrs. James Stredwick and Son, Silverhill Park, St. Leonards-on-Sea.

Mabel Crossley.—A charming little small-flowered Pæony Dahlia of good form. Florets fairly broad for so small a flower, evenly arranged round a pretty disc or centre. Colour, rich orange. Dark foliage. A useful plant for the border, being between 2 feet and 3 feet high. Shown by Mr. A. J. Cobb, University Gardens, Reading.

Mrs. Musgrave Hoyle.—This is a plant of promise, and is said to be a cross between Coltness Gem and Vrijbuiter. It is classed as a "charm" or miniature-flowered Pæony, and is said to be a plant 18 inches high and does not require staking, therefore ideal for bedding. The colour may be described as crimson-scarlet with yellowish disc. Shown by Mr. F. Smith, Morecambe Bay.

Successful display of Herbaceous Phlox

It is an undoubted achievement to be awarded two Gold Medals of the Royal Horticultural Society in one season for the same subject, and this has been accomplished by Mr. H. J. Jones, of Lewisham, S.E. This well-known grower staged a most noteworthy group of herbaceous Phlox in great variety at the fortnightly meeting held on July 30th last, and well merited the Gold Medal awarded to it at that meeting. He staged an even larger and more comprehensive group at the meeting of the R.H.S. held on the 13th inst., and was again awarded a Gold Medal for his superb display of these beautiful hardy flowers. This latter group was 36 feet long and 10 feet deep, and contained no fewer than 65 large stands and baskets arranged in an artistic manner, with a frontage of well-grown Maidenhair Ferns as a finish. Similar plants were also interspersed among the nearer stands most effectively. The display served to illustrate the great development that has taken place in this subject: the colours were pleasingly diverse, and some of the markings of the more fancy flowers most attractive. It may be well to mention some of the more noteworthy varieties, such as Maiden's Blush, blush-pink, rose eye; Antoine Merci, soft mauve, creamy-white eye; Europe, white, with distinct carmine eye; Mrs. H. J. Jones, mauve, shaded pink, carmine eye; Le Mahdi Improved, violet-blue; Attraction, a great improvement on the last-named; Winnie Magor, deep rosy mauve; Evangeline, a greatly improved Elizabeth Campbell, salmon-pink, with whitish centre; F. A. Buchner, pure white; Leo Schlageter, brilliant carmine, a most effective flower; Miss E. L. Billett, clear mauve; Mrs. T. Hay, a shade of rosy-mauve, paler centre; Thor, bright salmon-red, carmine centre; W. M. Jacobs, distinct colour of rich carmine; Mrs. A. F. Godfrey, satin-pink, soft carmine centre; Saladin, a glowing orange-scarlet, blood-red eye; Mrs. Geoffrey Curwen, a beautiful salmon-pink Ondine; and a host of others far too numerous to mention in this short note.

D. B. Crane.

Gardens in Ancient Greece

The Greeks of old cultivated flowers, not merely for the sake of their beauty, but on account of the immense use made of them in religious ceremonies and in daily life generally. The lover, going to visit his mistress, crowned himself with flowers, hung garlands of flowers upon her door, and adorned with wreaths the statues of the divinities who were supposed to preside over love or marriage. The worshippers in the temples, the audiences at the theatres, all, or almost all, wore garlands. At private parties also the guests were crowned with flowers, and often reclined upon masses of roses.

The Greeks idea of a garden included vegetables, fruit trees, and flowers, so arranged that the flowers were the most conspicuous part of the garden, the vegetables and fruit trees being fenced off and screened from observation by copses of Rhododendrons, Myrtle, and other shrubs. Popular flowers amongst the Greeks included such modern favourites as the Gillyflower, Pink, Carnation, Violet, Rose, Narcissus, and Hyacinth.

Lovers of gardens will appreciate the following lines written by a Greek poet called Chaeremon, who was named the "Flower poet." He was describing Grecian maidens sporting by moonlight, and follows on with this beautiful verse:—

"And slumbering near them others lay, on beds of sweetest flowers;
The dusky petaled Violet, the Rose of Paphian bowers,
The Inula* and Saffron-flower, which on their garments cast,
And veils, such hues as deck the sky when day is ebbing fast;
While far and near, tall Marjoram bedecked the fairy ground,
Loading with sweets the vagrant winds that frolicked all around."

N. C. W. Edge.

A great find in Val Ticino: Lilium Martagon with dark mahogany-coloured flowers

Suitable fences for the garden

There are few gardens in which fencing does not play some part, and this fact, unfortunately, often brings a note of discord into the garden, for one sees those horrible erections of wall topped with glass, or unsightly barbed wire, or iron constructions, in too many gardens. Cats and dogs must certainly be kept out of many a garden, and sometimes neighbours as well, but whether it is best to suffer their intrusion or to make the garden hideous by such "works of art" is very open to argument. There are many kinds of fencing for the garden which will harmonise with their surroundings, and at the same time would seem to be equally useful. The person with a large garden has a greater choice in fences, but even for the small garden there are quite a number which
will not detract from the restfulness
place in any way. The rustic fence is
the most charming; one often sees it
tage gardens, and one would do well
this type of fence, for it is easily mad

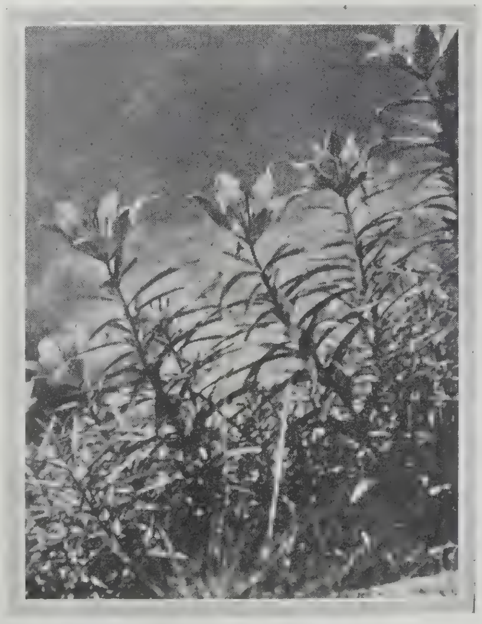
It is an interesting descent, and the
p and down the Ticino Valley are

y slopes are thick with a species of Ophioglossum or Adder's Tongue Fern and Campanula barbata, the latter showing considerable variation.

On the slopes the Orange Lily, which I take to be Lilium croceum, grows very freely. It was in full flower, sometimes solitary flowered and others two or three flowered. We did not observe any bulbils on this Lily; possibly they develop later. These large orange-coloured Lilies were gorgeous, mixed up in a tangle of Phyteuma, Campanula, Geranium, Cow Parsley, and Ox-eye Daisies. The day grew very hot, in marked contrast to the snowstorm yesterday. It was hotter still lower down the valley. Apollo and Swallow-tail butterflies were on the wing; also many Fritillary butterflies, which are common, and literally swarms of the Little Blue taking refreshment from sunny puddles on the track.



The Orange Lily (Lilium croceum) on the Alps of Ticino

Arrived in Airola to find P. R. B. and Needham at lunch—both surprised. We all returned to Madrano. Here we saw masses of Martagon Lilies, all in full bloom. They were literally growing by the acre, not in dozens, but in thousands. From a distance of about 100 yards I spotted one Lily that stood out from all others by virtue of its stature and dark colour. It was a black Martagon—a very dark form like Dalmaticum, but not woolly in the bud. It was a strong-growing, black-stemmed plant, over 5 feet high, and the flowers were entirely mahogany-purple, except the edges, which were rose-coloured.

P. R. B., camera in hand, in his eagerness to reach this noble Lily, slipped down the rough, steep, grassy slope, and would have slipped further but for the stiff Lily stems that saved him.

We were not out to collect plants, only to see and photograph them, but I could not leave this handsome Lily to waste its fragrance on the desert air. This one bulb was removed—the only one. The soil here is a good, deep, alluvial loam, and this I had to remove with my axe to a depth of a foot before reaching the golden-coloured bulb. This Lily is stem rooting, in spite of the statement made over and over again that Martagon is base rooting only.

Above Madrano the track forks, and the track to the right leads to Cop alto: At the fork I left my friends, who returned to Airola. The right hand track passes through a wood, in which the White Martagon is abundant. It appears to replace the type. It is not a good form of Martagon album—some flowers are pure, others nearly so; even the best specimens I saw would not compare favourably with the White Martagon in cultivation. Nevertheless, it was interesting to see this albino as a wilding.

In the same wood grows Paris quadrifolia, with five leaves! Above the woods Aster alpinus was flowering well near colonies of Paradisia Liliastrum.

Although the day was hot down in the Ticino Valley, it was bitterly cold when I reached Fongio, and I was beginning to feel the effects of a strenuous day. Two children were sheltering from the cold wind under a good-natured cow while their mother near by was milking.

Happily I was here able to get a can of

milk warm from the cow, after which I proceeded on my way refreshed and with a light heart—or, as Autolycus would say—

> A merry heart goes all the way
> Your sad tires in a mile-a.

(To be continued.)

Double White Narcissus

THE Gardenia-flowered Narcissus (N. poeticus fl.-pl.) is at once one of the most prized, and, to many, because of the so-called "blindness" to which in certain conditions of soils it is prone, certainly one of the most disappointing of the comprehensive race of bulbous-rooted plants to which it belongs. In season late in the Daffodil year, when the flower wealth of its tribe is over, it is ever esteemed on that account, though in increasing measure, perhaps, because of a purity, fragrance, and general utility which render it admissible into many phases of cut flower and decorative work. Great, however, as is the value attaching to it for these reasons, it would be small, indeed, compared with what might be were the variety amenable to the same treatment as the majority of its race, succeeding well under intelligent garden cultivation and affording a crop of flowers annually as the reward of the labour and the cultivation bestowed. It is not so, however, while its lack of reliability places a heavy discount on its value. Disappointing to market growers and others, and peculiarly unprofitable commercially to those gardening on sandy, light, and stony soils, it is just as disappointing to a large number of amateurs who, in other circumstances, would value it at its full worth.

As the moment is opportune for planting the Narcissi no apology is offered for giving particulars as to the idiosyncrasies of the variety under review, with some of the causes leading up to the so-called "blindness." A quarter of a century or more ago this failing to flower was much discussed in gardening journals by leading market men and prominent amateurs, who variously attributed it to "late spring frosts," "drying east winds," and things akin after the flowering scapes were prominent above ground. Blind flowers, so-called, were abundant, albeit the foliage was healthy, the scapes (flowering stems) strong. The variety flowered late, *i.e.*, in May, when conditions of dryness and increasing solar heat were but natural. The soil was good, light loam, fifty years old pasture recently brought into cultivation, though much drained by reason of a deep bed of gravel and sand below, which in summer rendered it dust dry. With such conditions obtaining, it was noticed—and the fact would be obvious to the most casual observer—that leaf maturity in the case of the Double White was much earlier reached than was the case with other sorts flowering weeks in advance of it, and, knowing that in the Narcissi the germ of any season's flowering is virtually laid with the maturing of the leaf growth in the previous year, caused me to decide that I had touched the root of the whole matter. In other words, I decided that the late flowering of the variety, the much-drained soil, absence of atmospheric and root moisture, with increasing heat combining to an appreciably shortened period for the manuring of bulb and foliage, were the chief factors of the failing. In fine, that imperfectly-formed flower-buds being laid, blindness was assured practically a year in advance of its becoming apparent. Subsequent experiments with bulbs in pits sheltered from the weather and treated on a semi-aquatic plan proved the contention right. A year or two later, in a private garden I came upon a few scattered groups of it at a pond-side and in fine flower. The Narcissi had been there for years, and without care or attention came up and flowered well annually. In winter they were many times under water, and at other times always in cool or moist soil. The pond-side soil was stiff, the quality poor, the former, the constant moisture and a permanent tenure of the soil favouring the vigour and good flowering of the plants. Since that time I have repeatedly urged deep planting of the variety in cool or moist loams, or where the root-fibres would be practically in touch with moisture with, as I know in many instances, the best results.

Obviously, root and atmospheric dryness is abhorrent to it, and this, in conjunction with summer heat, impelling premature ripening of the growth directly responsible for the failing known as "blindness." Hence the remedy should be clear. Deep planting, *i.e.*, 6 inches below ground, is also desirable. A let-alone principle, too, is best. In other words, annual lifting and drying-off are wrong. This and other poeticus varieties are almost perpetual in their rooting, and suffer if long kept out of the soil. Of the variety N. p. ornatus a noted grower once declared that "five minutes out of the ground was four minutes too long for it," a neat way of saying that, in his opinion, it should only be lifted as occasion demanded, and be replanted without drying off and with as little delay as possible. Much the same thing applies to the Double White, which, while useless for forcing, is of especial value for late work, and doubly so if treated on the lines indicated in order that the so-called "blindness," which is still rife in the land, may be averted.

J. S. S.

From Gardening Illustrated

Fifty Years Ago

How to dig

AN indifferent man will simply shuffle over the ground, inserting his spade at an angle of 45 degs., and turning the soil over to a depth of about 6 inches, whilst a man who understands how to dig and perform his work properly will keep a straight and open trench, put his spade in perpendicularly, take thin spits, and turn the soil over thoroughly, breaking it well as he goes on, and do the work generally as it should be done. There is a vast difference between good and bad digging, and I never met with a labourer out of a garden who knew how to dig, however good a workman he might be in other respects. If the soil is broken up well in the trench I never care about the surface being a little rough; a raked surface among vegetable crops is an unmitigated evil at any time.—August 23rd, 1879.

Bulbs for forcing

Get the main batch of these potted or boxed up, as the case may be, and plunge them in ashes at the north side of a wall or fence. The labels should stand well above the plunging material so that each kind may be easily recognised. A few Lilies should also be included, and may be plunged in the same way, those of the longiflorum type being, perhaps, the most suitable.

Better Leeks

It is generally conceded that Le
among the easiest and most profit
vegetables to grow for a general crop
table for winter. Unlike the Onion,
not subject to the ravages of the fly
consequences which follow, and wh
they are planted in rich ground
not call for very much attention. Th
of a moderate-sized garden may not
garded them as a crop needing spe
ture, but the difference between
sticking plants in " and leaving them
their chance, and plants which ha
given stimulating food, and helped by
the soil drawn round them, keeping
the hearts, and going a step further
around them stiff brown paper to
them, all shows itself when the tim
for digging them up, say, in Decem
other words, the extra attention we

REMINDERS FOR THE WEEK

Southern and Midland

Apricots

These have been better than usual this season, and the crop having now been gathered, attention must be given to the tying in of strong leading shoots, some of which may be required to replace small branches which have died during the summer. All other growths may be cut back to within three or four eyes of their base. The trees should not be permitted to suffer from lack of moisture at their roots, and a brisk overhead spraying occasionally will assist in keeping them clean and healthy.

The Pear crop

This is a heavy one here, and early varieties must be netted against small birds, otherwise a large amount of the fruit will be rendered unfit for use. Wasps, too, are very troublesome at this season, and bottles or jars half-filled with sweetened beer should be hung upon the trees to attract them from the fruits. Water should be copiously given whenever possible during their final swelling.

Loganberries

Remove the old canes without delay and reduce the young ones to four or five of the best, placing stakes of some kind among them to prevent damage by rough winds. A mulch at this season will prove very beneficial. This same treatment applies to perpetual-fruiting Raspberries, the current year's canes of which are already producing nice fruits.

Black Currants

Now that the fruits have been gathered, spray the bushes with quassia and nicotine twice—at intervals of 10 days—and thus check the development of Big Bud. Give copious supplies of water, and, if not already carried out, place a mulch of some kind over their roots.

Celery

The earliest rows will now be ready for earthing up, but before fresh soil is added to the plants it is most important that a thorough soaking should be given either of water or liquid-manure, as, once earthing-up commences, both watering and feeding become more difficult. This done, choose a day when the foliage is dry and place about 4 inches of soil over the base of the plants, collecting the leaf-stalks in one hand and keeping them held tight together whilst the soil is pressed firmly about them with the other. A further addition of soil will be necessary every fortnight, and if a scattering of soot is applied among the plants after each earthing slugs will prove less troublesome.

Onions

Those transplanted from boxes to form large bulbs often develop a thick neck. To check excessive growth of this kind the stems should be very carefully bent over, as this will promote firmness and encourage the more rapid development of the bulbs. Where growth is still green and strong feeding may continue, but where the foliage has already ripened, the bulbs should be drawn out and allowed to finish in an open, airy shed.

Late Peas, Runner Beans, and salading plants

These must not be permitted to suffer from lack of moisture on any account at this season, and they will derive considerable benefit from generous applications of diluted manure-water. Insect life will be combated by generous overhead sprayings of clear water in the evening or early morning.

Dahlias

Remove all dead blooms every few days, otherwise successional flowers will be small and numerous. Add more stakes where the plants have made good or excessive growth, and keep them well supplied with diluted manure-water. A few lengths of Bean-stalks placed between stake and growth will form excellent traps for destructive earwigs.

Autumn sown annuals

Now is the time to order the seeds of any it is desirable to grow in the open, hardy kinds only being chosen. These include Cornflowers, Collinsia bicolor, C. grandiflora, and C. grandiflora carminea, a lovely thing; Godetias, Nemophila insignis, N. maculata, and the white N. atomaria, Gilia densiflorus, Omphalodes linifolia, Ionopsidium acaule, and others, including a quantity of Sweet Peas, for which trenches should now be prepared in readiness for sowing the second week in September.

Bouvardias, Salvias, Poinsettias, Coleus thyrsoides, and Eupatoriums

If these are now being prepared for flowering indoors during winter and early spring they should be encouraged in every way by careful feeding. No further stopping is necessary or advisable after this date.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Pot up Freesias

If not yet done, it is now advisable to shake the bulbs out of the old soil, selecting the largest only, for growing on again. Place about seven bulbs in a 5-inch pot, using a nice, sweet compost of about equal parts of fresh, fibrous loam and sweet, flaky leaf-mould. Enough clean, sharp sand should be added to ensure proper porosity. Set the pots after they are filled on an ash bed in a cold frame, but do not give much water until growth begins to show through the soil.

Roman Hyacinths

As soon as procurable have the necessary number potted or boxed and "plunged" under sand or very old coal ashes in some corner out of doors, there to remain for six weeks or so to permit of the bulbs producing an abundance of roots, without which but poor success will be had with this or any bulb.

Autumn propagating

It is now time to get in cuttings of such tender bedding plants as Ageratum, Heliotrope, Fuchsia, Lobelia, and Verbena. Use boxes or pots filled with fresh sandy compost. The cutting-boxes when filled should be set in cold frames, where they should be kept close and shaded from all sunshine. If given a good watering immediately they are inserted no more water should be necessary for quite a long time, although, of course, the soil must never be permitted to get really dry.

Zonal Pelargoniums

The showy "Geranium" is still quite popular in many gardens and gives a really attractive display on light, dry soils. Cuttings should now be taken wherever procurable and inserted in pots or boxes, these receptacles being filled with very sandy compost. Set in full sunshine for a few weeks, but adopt some method whereby rain can be shed from the cuttings, for to allow the soil to get really sodden is to encourage damping-off of the cuttings. Spare glass sashes raised on large pots answer the purpose adm
for, besides keeping off wet, they adm
and a circulation of air around the cu

Planting Daffodils

Preston House Gardens, Linlithgow

Horticulture in the West

JNTON'S fifty-seventh annual show rnished ample evidence of the en- usiasm of West Country folk for their ıs, and a recognition of this love of s was shown by a numerous band of growers from all parts of the country, exhibits were staged in a magnificent fty tent 220 feet in length. If it were e to estimate the influence of horicul- hows on gardens and gardeners, that nton would rank very high. The ex- ı was held in the town's spacious park, an excellent programme of music was ed by the band of the Life Guards.

ng a collection of interesting shrubs ex- by Messrs. R. Veitch and Son, of , was Escallonia Donard's Seedling. ybrid, which is not yet very common lens, originated by crossing E. langley- vith E. philippiana. It bears a profuse y of light pink blossoms, and the speci- ıown was flowering for the second time ison. A berry-bearing specimen of Sea ıorn was literally crowded with fruit. ıould be grown in proximity to a male n order to ensure a winter display of and these, Mr. Bean assures us, are aten by birds. The Bottle-brush shrub emon salignus) was a new sight to folk. It is described as a greenhouse but it thrives outdoors in several dis- n the West Country. A fine flowering of the Hoheria populnea lanceolata e attracted notice. This New Zealand s rarely seen in gardens, but it is quite plant it in warm corners in western uthern garden. It produces abun- usters of pure white flowers, and it has -toothed foliage.

rs. Maxwell and Beale, of Broadstone, made an interesting display of Heaths g in a miniature rock garden. This demonstrated how the members of scinating family may be utilised in the ı of natural effects. It is not generally that you may have Heaths of one sort ther in flower throughout the whole nd a section of the garden almost en- evoted to these plants is a worth-while tion. Although a sandy peat is ideal for lants, the lack of peat need not deter lovers from makine an attempt at ılture, as they will grow in any light, soil in which there is no lime. Two s of outstanding merit are Mrs. D. F. ll and Lyonesse. These are red and flowered forms of Erica vagans, the ı Heath. E. ciliaris hybrida is another g kind which was evolved by crossing ımon Dorset Heath with E. tetralix.

ng the big display of Gladioli staged ssrs. Kelway, of Langport, the rich tion of Orby caused much comment. ge crimson flowers are borne on im- spikes. James William Kelway is striking variety with crimson flowers. ımson-scarlet Appollus was also much l, and I was told by the attendant is variety looks exceptionally fine in light. Some well-grown spikes came essrs. Webber and Son, of Minehead, which were Souvenir and Golden e, two varieties well known to readers ARDENING ILLUSTRATED." In spite of ltitude of new varieties, some of these inds still retain their popularity. A oup of named varieties of Scabiosa ca came from Messrs. House and Son, stbury-on-Trym. The flowers had igid stems, and were perfect in sub- and colour, but it would need the eye expert to differentiate between the kinds. Ethel is a very definite im- ent on the old white-flowered kind. ouse has made the Scabious his own flower, and his desire to achieve a pink-flowered form is an open secret. He also showed some beautiful branching flower sprays of the Russian Sage. It has dainty mauve blossoms, and should be grown largely for cutting purposes.

It is good to know that there are still some Canna enthusiasts. Mr. R. J. Case, of Staplegrove Nurseries, Taunton, is one of these, and his collection of modern kinds was very cheering. Four varieties of merit were Burbank, canary-yellow, mottled throat; B. V. D. Schoot, bright yellow, spotted crimson; Heroys, orange self; and Pearl of Schwaben, dark velvety-crimson. In generously manured soil and deeply dug soils these plants make ideal summer bedders. They flower continuously and their foliage is noble in form. A praiseworthy attempt to give visitors something of educational value was made by Messrs. John Scott and Co., of Merriott, Somerset. An effective portrayal of Chinese landscape gardening was made by the planting of miniature specimens of Retinispora, Cupressus, Juniperus, and Spruce in undulating sand between rocky boulders. Some attempt was made to illustrate the effects of light, whilst those Conifers with bluish-grey foliage were employed to lend distance. Altogether one gathered the impression that one might employ dwarf Conifers much more freely in the creation of foliage effects, especially in gardens where winter effects are lacking. The merits of the Chase Continuous Cloche were amply demonstrated by the inventor, who had a series of cloches with seedlings growing under their protection. This is certainly the most economical and handy method of affording glass protection. The garden sculptuary of Mr. A. E. Sheppard, of Bath, indicated a growing taste for this mode of garden decoration. His examples were all hand-cut, and the stones after exposure to climatic influence assume a soft shade of grey. Modern Phloxes were shown well by Messrs. Rich and Cooling, of Bath. Sorts of special merit and distinction were Graf Zeppelin, an improved form of the popular Europa; Antonin Merci, large white flowers with fadeless lilac margins; and H. B. May, an immense pink variety. Messrs. Dickson, Brown, and Tait, of Manchester, are justly proud of their new giant Dahlia-flowered Zinnias. The flowers are immense and the colouration good. I conclude these notes with the names of some Roses which attracted special admiration in the collection shown by Mr. Thomas Robinson, of Nottingham: Lady Worthington Evans, blackish-crimson, semi-double, good bedder; Mabel Lynas, very fragrant, crimson with yellow base; I Zingari, orange and scarlet, semi-fragrant; Desmond Johnson, brilliant scarlet, tinged orange, early; Eva Eakins, scarlet, flushed orange, coral centre; and Golden Salmon, a fine dwarf Polyantha Rose of an intense shade.

H. GREAVES.

National Carnation and Picotee Society

The sixth annual exhibition of the Northern Section of the National Carnation and Picotee Society was held in the Cutlers' Hall, Sheffield, on Saturday, August 10th. The show was held in conjunction with the "Sheffield Gardeners' Tribute to the Blind" Flower Show, and proved a considerable success. As a result it is expected that a good sum will be handed over to the funds of the Local Institute for the Blind.

Dr. Mead (President of the Society) at the opening ceremony pointed out that the Border Carnation was a hardy plant, and from personal experience he could say it was considerably hardier than the spring cabbage. Border Carnations were not fastidious as to soil or surroundings, many of the flowers exhibited in the show and taking first prize having been grown within one mile of the city's great steel works. Border Carnations were not, as some people imagined, greenhouse flowers.

NEW VARIETIES EXHIBITED.

The following new varieties were exhibited for certificates:—Exhibited on July 31st. Miss Horn, rose-pink, clove scented. Awarded First Class Certificate with 97 points out of a possible 100. Raised by Messrs. Torrance and Hopkins, Busby, Glasgow.

Mrs. G. Hill, white ground fancy, marked rosy-scarlet. Awarded First Class Certificate. Ben Beswick, salmon-rose self. Awarded Award of Merit. Both raised and exhibited by Mr. G. Hill, Sheffield.

Exhibited on August 10th.—Glenfarg, buff ground, suffused salmon-pink. Awarded Award of Merit. Glen Shee, white ground, heavily marked crimson. Awarded First Class Certificate. Both raised and exhibited by Mr. John Macfarlane, Airdrie, Scotland.

Jean Secker, yellow ground, marked and edged lavender and scarlet. Awarded Award of Merit. Raised by Torrance and Hopkins, Busby, Glasgow; exhibited by Mr. Wilfred Secker, Sheffield.

THE PRINCIPAL PRIZE WINNERS.

Mr. J. Macfarlane, of Airdrie, Scotland, was the most successful exhibitor at the show, and was awarded the Silver Cup for the best amateur display of Border Carnations. In his display a bowl of a dozen or so Kelso was specially attractive, and other varieties of merit were Florence Grisby, Mrs. Edmund Charrington, Sam Griffiths, Mrs. D. Thomas, and Ebor. Mr. Macfarlane took eight first prizes and one second in the open classes, and was awarded highest points and the Society's Silver Medal.

Premier prizes were awarded to Mr. J. Macfarlane for Peter, yellow self; Steerforth, white ground fancy and clove scented; Linkman, yellow ground fancy; Sam Griffith, fancy other than white or yellow ground; and to Mr. S. Rabjohn, Sheffield, for Exquisite, yellow ground Picotee. The Silver Cup presented by Mrs. G. H. Mead was awarded to Mr. Macfarlane for his Linkman, stated by the judges to be the best Carnation ever exhibited at a northern section show. This flower outclassed even Mrs. Edmund Charrington, a variety which had taken this award at all five previous shows.

In the Amateur Classes for plants grown in the open border, Mr. Wilfred Secker (Secretary) secured the chief awards, winning the President's Challenge Cup and the Society's Silver Medal for the third year in succession, and also taking the Silver Medal presented by Messrs. Torrance and Hopkins, of Glasgow, for the best bloom of Jean Secker in the show. He also won special prizes for the best bloom in the amateur Classes with Florence Grisby, a new yellow ground fancy, and for white ground fancies with a vase of Monica, Woodpark, and Mrs. Edmund Charrington. Other leading winners in the chief classes included Mr. W. H. Rhodes, Mr. H. E. Pearson, and Mr. W. Ford for plants grown under glass. Mr. S. Rabjohn was awarded the Society's Silver Medal for highest points, taking first prize in all eight classes. In the division for novices, open border grown, the principal winners were Mr. G. T. Evans, Mr. G. Cornish, Mr. G. H. Rotherham, and Mr. B. Morrison.

The "GARDENING ILLUSTRATED" Medal for highest points was awarded to Mr. G. T.

Evans. Special prizes by Torrance and Hopkins, Glasgow, went to G. H. Rotheram, G. H. Camish, and B. Morrison.

In the ladies' class for a vase of Carnations arranged for effect, the cut glass and silver Rose bowl presented by H. E. Bridgewater was awarded to Mrs. Wilfred Secker.

A Walnut competition

The Royal Horticultural Society have arranged a Nut competition to be held on November 19th. There are classes for Walnuts, Cob Nuts, and Filberts. The main object of the Walnut competition is to discover good varieties, for it is well known that the majority of Walnut trees in this country are seedlings, and, consequently, they vary considerably, for each seedling is a distinct variety. The nuts borne by many compare unfavourably with imported nuts, and as a result the bulk of the Walnuts consumed in this country are brought from abroad. One of the conditions of the competition is that successful competitors shall, if desired, supply twelve shoots from each prize-winning tree from which scions for grafting can be made. Each competitor who sends scions will in due course receive two young trees obtained from his scions, and the remainder of the young trees, if they prove satisfactory, will be used for the further propagation of the variety. The Ministry of Agriculture is providing part of the money for the prizes. Anyone who has Walnut trees may have a variety worthy of extended cultivation, and he is invited to compete and thus assist in the search for good varieties. Schedules may be obtained from the Royal Horticultural Society, Vincent Square, Westminster, S.W. 1.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FLOWER GARDEN

Remaking herbaceous border

(Aldershot).—1.—Autumn is undoubtedly the best time to remake your border, and if you can get the planting done by the end of October it will prove of great advantage to the plants, which will make fresh roots before the soil has gone too cold, and thus pass the winter safely. Growth will be much stronger than if planted in the spring. 2, Planting Carnations.—The early part of October is most certainly the best time to plant Carnations of the hardy varieties. 3, Housing Azalea indica.—They should be placed under cover the second week in September or before the end of the month at the latest. 4, Violas diseased.—This is Viola Rust, to combat which the plants should be sprayed with Bordeaux Mixture, or well dusted, when the foliage is damp, with green sulphur. It is proving very troublesome this year.

Annuals and perennials

Kindly recommend a selection of the more choice and unusual annuals and perennials that are likely to succeed in a border of light, very well-drained soil, in full sunshine and some shelter east and north. The border is roughly 40 yards in length and 3½ feet in width and backs up to a fence.

I would also like a selection of flowers for cutting to grow in similar soil and aspect—Pyrethrum, Scabiosa caucasica, Romneya Coulteri I am fond of if these would be likely to succeed.

Perhaps I ought to mention that the border appears to need some enriching, and I thought of digging in cow manure if obtainable, failing which, stable manure, in the autumn. The soil is so well-drained that it is possible to work it an hour or two after even heavy rain. FLOWER LOVER.

[It is not at all easy to choose collections such as you desire suitable for the soil and position you name. You would require to double-dig the border, adding plenty of half-rotted cow manure, for most of the following. Perennials.—Alyssum saxatile citrinum, Arabis Taplow Rose, Armeria latifolia rubra, Asters (Michaelmas Daisies), King George, Beauty of Ronsdorf, Mrs. Perry, Pink Pearl, Thompsonii, and subcœrulea, Catananche cœrulea, Cheiranthus alpinus, Dianthus neglectus, Erigeron B. Ladhams, Geum Orangeman, Heuchera brizoides, Incarvillea Delavayi, Linum narbonense, Mertensia virginica, Romneya trichocalyx, Salvia virgata nemorosa, Saxifrages of sorts, Veronica spicata Royal Blue. Annuals.—Nemesia, Dimorphotheca, Ryburgh Hybrid Poppy, Antirrhinums in great variety, Dianthus Heddewigi, Phlox Drummondii, Scabious, and Zinnias. For cut flowers.—Aquilegias, Pyrethrums, Geums, Pinks, Michaelmas Daisies, Border Chrysanthemums, Heuchera brizoides, Nepeta Mussinii, Tulips, Spanish and English Irises, Mignonette, Anemones, Gladioli, Eschscholtzias, Phloxes, Nigella, and Coreopsis grandiflora.]

Meconopsis Baileyi

If seed of above is sown now, should the plants from it bloom next spring, and should they be pricked out when fit to handle and wintered in a cold frame or in a greenhouse? A reply to these queries in your valuable paper will greatly oblige.

Salop. THOS. ALDERSEY.

[Seedlings raised this autumn will not bloom until June, 1931. They may be pricked off when large enough to handle or they may remain in the seed-pans until growth commences next spring with almost equal results, providing they are kept in a cold frame. Such plants should be ready for planting in the open in April, 1930, using a fair proportion of leaf-mould in the soil at all times, partial shade suiting them best.]

Lilium candidum

(J. W. B. W.).—See note on planting, issue August 17th, page 562.

Lily disease

(M. E. Greenwood).—Your Lilies are attacked by the so-called Lily disease, which is caused by a fungus, Botrytis sp. All the aerial portions are attacked, but the bulbs usually remain sound. The degree of attack depends to a large extent upon weather conditions. Under good growing weathe
ditions the disease is rarely epidemic,
cold, drying winds are experienced fro
north and especially north-east, the
spreads rapidly. All diseased portions
be carefully removed and burned; wh
young growth appears spray from ti

nt time or left until the end of April
r. The very best manure for Holly
s old farmyard which has been in
a stack for a while; this is not only relished by them, but acts as a valuable mulch also. Failing this, you could scarcely improve upon good bone-meal obtained fresh from a reliable horticultural sundriesman. This may be used at once, well soaking it in, 2 ozs. to each square yard applied every month or six weeks will prove most beneficial, and if it is possible to scarify it into the surface before water is applied, it is advisable to do so.

Beech tree trouble

(C. E. S. Bower).—Your Beech appears to us to have been badly crippled with caterpillar. At this stage it is impossible to say what caterpillar was concerned, but Winter Moth is a likely culprit. Try the effect of placing a grease band in position as you would for an Apple tree. If the tree is only 10 feet high, spraying with a tar oil wash, at 5 per cent. in January, would be useful towards improving the foliage. If you can keep the foliage good and whole for a season or two, the tree should get away. Is the drainage good?

Trimming hedges

Will you kindly advise me as to which, generally, is regarded as the best month for trimming hedges of (a) Beech, (b) Holly, (c) Yew, and also the best month for more severe pruning or shaping (as distinct from mere surface trimming). If these three subjects require to be dealt with individually at differing times of the season, perhaps you will be good enough to let me know the appropriate months for treatment of each.

D. K.

[(a), (b), and (c) should be clipped annually between July and September, and all will grow thicker and healthier if made to narrow upwards. Any harder pruning is best carried out about the first week in April, just before new growth commences.]

Berberis for name, and culture
